Important Notice

Before you start the RAID Controller to manage your hard disk drives, please pay attention to the following notice.

Recommended Hard Drive

To avoid incompatibility between RAID Controller and hard disk drives, we strongly suggest you use Seagate Barracuda® ES drives. For details on the drives, see Seagate's website: http://www.seagate.com/www/en-us/products/servers/barracuda_es/

The following is the available models of Barracuda® ES drives:

Model	Capacity
ST3250620NS	250GB
ST3320620NS	320GB
ST3400620NS	400GB
ST3500630NS	500GB
ST3750640NS	750GB

Begin with BIOS Configuration

The GV-DVR system provides two methods to configure RAID arrays:

- BIOS Configuration
- Web-Based Configuration

When building RAID for the first time, please use BIOS configuration only. If you use the web-based configuration, RAID build will fail. Later you can use the web-based configuration to manage the RAID Controller system.

For details on the BIOS configuration, see Chapter 2 and 3. For details on the web-based configuration, see Chapter 4 and 5.

Order of Hard Drive Slots

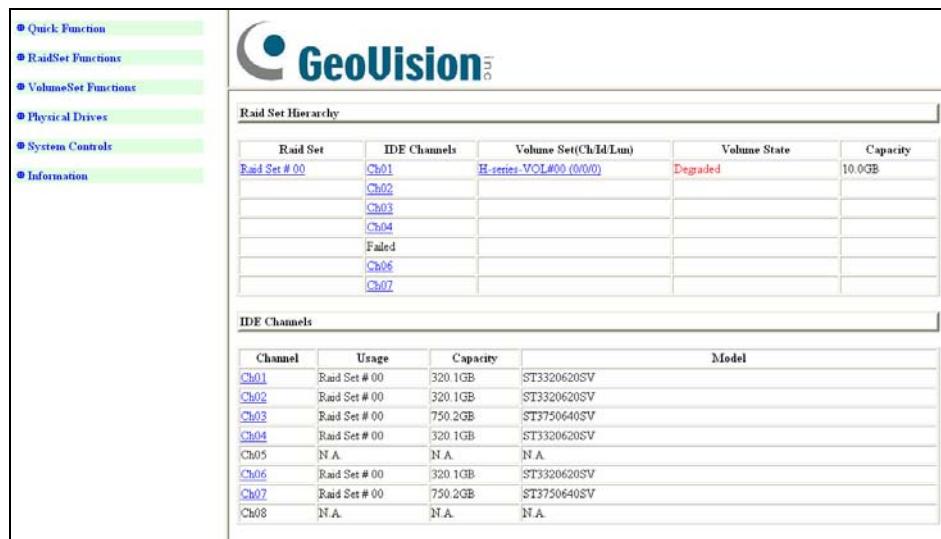

Remember the order of hard drive slots on the GV-DVR System. When there is a warning message or buzzer on the failed hard drive, follow these procedures:

1. Check which hard disk failed from “Raid Set Hierarchy” of the web-based configuration page.
2. Remove the failed one in the correct slot.

Warning: If you remove the hard drive in the wrong slot, you could suffer data loss.

- **Raid Set Hierarchy:**

In \ Information \ RaidSet Hierarchy, you can view the status of each hard drive. In this figure, Ch05 (hard drive No. 5) failed.

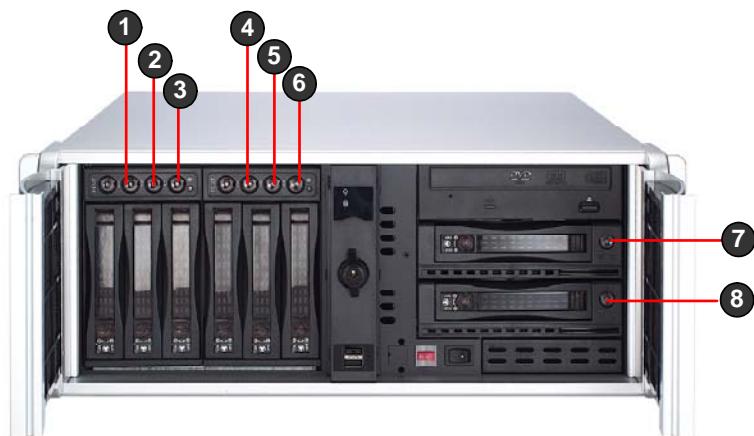

The screenshot shows the 'Raid Set Hierarchy' table with the following data:

Raid Set	IDE Channels	Volume Set(Ch/Id/Lun)	Volume State	Capacity
Raid Set # 00	Ch01 Ch02 Ch03 Ch04 Failed Ch06 Ch07	H-series VOL#00 (0/0/0)	Degraded	10.0GB

The 'IDE Channels' table shows the following hard drives:

Channel	Usage	Capacity	Model
Ch01	Raid Set # 00	320.1GB	ST3320620SV
Ch02	Raid Set # 00	320.1GB	ST3320620SV
Ch03	Raid Set # 00	750.2GB	ST3750640SV
Ch04	Raid Set # 00	320.1GB	ST3320620SV
Ch05	N.A.	N.A.	N.A.
Ch06	Raid Set # 00	320.1GB	ST3320620SV
Ch07	Raid Set # 00	750.2GB	ST3750640SV
Ch08	N.A.	N.A.	N.A.

- **The order of hard drive slots:**

1. Overview of RAID

RAID is an acronym of *Redundant Array of Independent Disks*. It is an array of multiple independent hard disk drives that provides high performance and fault tolerance.

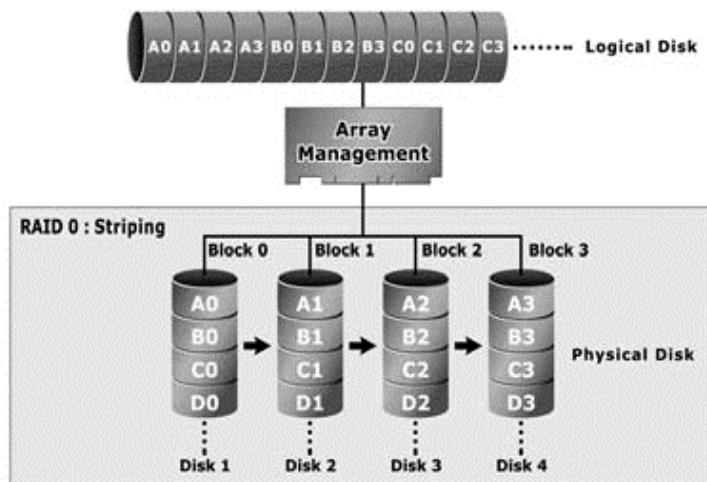

The RAID Controller provides non-stop service with a high degree of fault tolerance through the use of RAID technology. It also features advanced array management. It makes the RAID implementation and disks' physical configuration transparent to the host operating system, meaning the system drivers and software utilities are not affected, regardless of the RAID level selected.

1.1 Different RAID Levels

RAID Levels are a series of configurations of RAID. Each level has its way of connecting the hard drives, writing and retrieving data. The descriptions below introduce some commonly used RAID Levels.

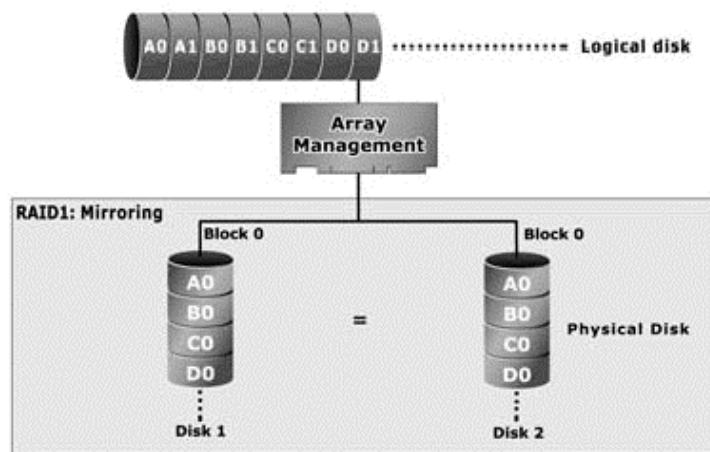

1.1.1 RAID 0

Also referred to as striping, RAID 0 writes stripes of data across multiple disk drives. RAID 0 does not support fault tolerance and redundancy, but performs fast in writing and reading data. RAID 0 breaks up data into smaller blocks and then writes a block to each drive in the array. Disk striping enhances performance because multiple drives are accessed simultaneously. With the lack of redundancy, RAID 0 is less reliable because the entire array fails when any one disk drive fails.

1.1.2 RAID 1

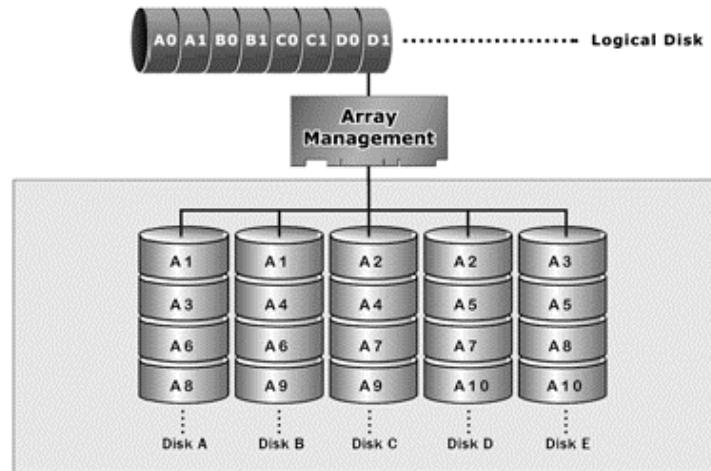

RAID 1 is also known as disk mirroring. Data written to one disk drive is simultaneously written to another disk drive. Read performance may be enhanced if the array controller can, in parallel, access both members of a mirrored pair. The write performance is not highly effective in comparison of writing data to a single disk. If one drive fails, all data (and software applications) are preserved on the other drive. RAID 1 offers extremely high data reliability, which demands a high cost of data storage capacity.

1.1.3 RAID 1E

RAID 1E is a combination of RAID 0 and RAID 1, combining striping with disk mirroring. RAID level 10 combines the fast performance of Level 0 with the data redundancy of Level 1. In this configuration, data is distributed across several disk drives, similar to Level 0, which are then duplicated to another set of drives for data protection. RAID 1E has been traditionally implemented using an even number of disks, some hybrids can use an odd number of disks as well.

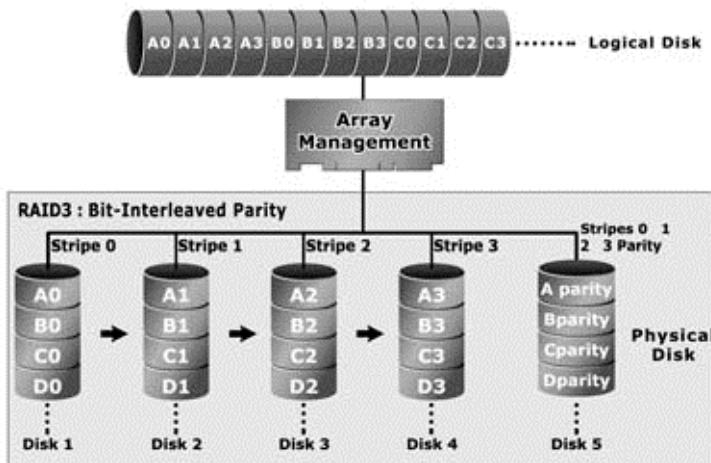

The graph below is an example of a hybrid RAID 1E array comprised of five disks: A, B, C, D and E. Each stripe is mirrored on an adjacent disk with wrap-around. When the number of disks comprising a RAID 1E is even, the striping pattern is identical to that of a traditional RAID 1E, with each disk being mirrored by exactly one other unique disk. Therefore, all the characteristics for a traditional RAID 1E apply to a RAID 1E when the latter has an even number of disks.

1.1.4 RAID 3

RAID 3 provides disk striping and complete data redundancy to a dedicated parity drive.

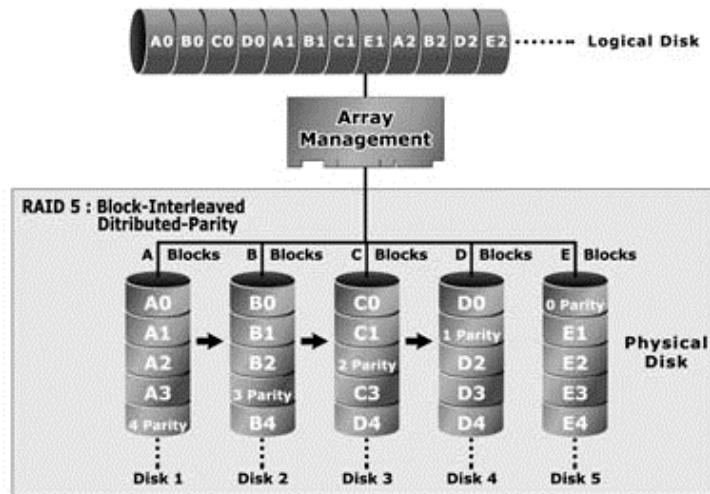

RAID 3 breaks up data into smaller blocks, calculates parity by performing an exclusive or on the blocks, and then writes the blocks to all but one drive in the array. The parity data created during the exclusive or is then written to the last drive in the array. If a single drive fails, data is still available by computing the exclusive or of the contents corresponding stripes of the surviving member disk. RAID 3 is best for applications that require very fast data – transfer rates or long data blocks.

1.1.5 RAID 5

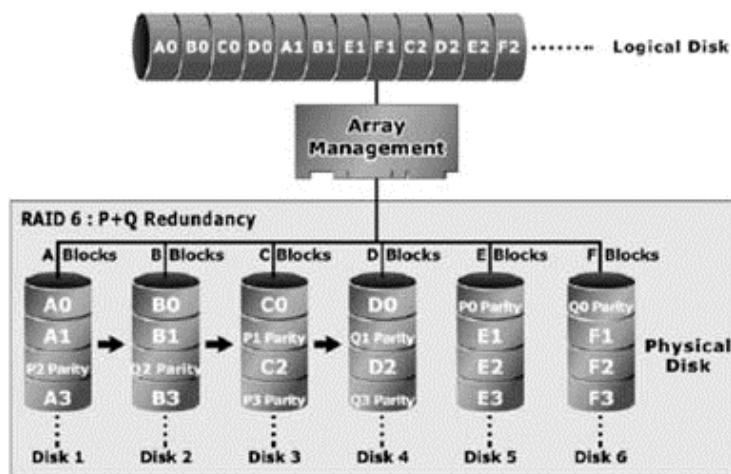

RAID 5 is sometimes called striping with parity at byte level. In RAID 5, the parity information is written to all of the drives in the controllers rather than being concentrated on a dedicated parity disk. If one drive in the system fails, the parity information can be used to reconstruct the data from that drive. All drives in the array system can be used to seek operations at the

same time, greatly increasing the performance of the RAID system. This is also the primary reason that RAID 5 is more often implemented in RAID arrays.

1.1.6 RAID 6

Similar to RAID 5, RAID 6 performs two different parity computations or the same computation on overlapping subsets of the data. RAID 6 offers greater fault tolerance but only consumes the capacity of 2 disk drives for distributed parity scheme. Data is striped on a block level across a set of drives, and then a second set of parity is calculated and written across all of the drives.

1.1.7 Summary of RAID Levels

Features and Performance					
RAID Level	Description	Min. Drives	Data Reliability	Data Transfer Rate	I/O Request Rate
0	<ul style="list-style-type: none"> Also known as striping Data distributed across multiple drives in the array. There is no data protection. 	1	No data protection	Very high	Very high for both Reads and Writes
1	<ul style="list-style-type: none"> Also known as mirroring All data replicated on N separated disks. N is almost always 2. This is a high availability solution, but due to the 100% duplication, it is also a costly solution. Half of drive capacity in array are devoted to mirroring. 	2	<ul style="list-style-type: none"> Lower than RAID 6 Higher than RAID 3 and 5 	<ul style="list-style-type: none"> Reads are higher than a single disk. Writes are similar to a single disk. 	<ul style="list-style-type: none"> Reads are twice as fast as a single disk. Writes are similar to a single disk.
1E	<ul style="list-style-type: none"> Also known as Block-Interleaved Parity Data and parity information are subdivided and distributed across all disks. Parity must be equal to the smallest disk capacity in the array. Parity information normally stored on a dedicated parity disk. 	3	<ul style="list-style-type: none"> Lower than RAID 6 Higher than RAID 3 and 5 	<ul style="list-style-type: none"> Transfer rates are more similar to those of RAID 1 than RAID 0. 	<ul style="list-style-type: none"> Reads are twice as fast as a single disk. Writes are similar to a single disk.
3	<ul style="list-style-type: none"> Also known as Bit-Interleaved Parity. Data and parity information are subdivided and distributed across all disks. Parity data consumes the capacity of 1 disk drive. Parity information normally stored on a dedicated parity disk. 	3	<ul style="list-style-type: none"> Lower than RAID 1, 1E and 6 Higher than a single drive 	<ul style="list-style-type: none"> Reads are similar to RAID 0 Writes are slower than a single disk 	<ul style="list-style-type: none"> Reads are close to being twice as fast as single disk Writes are similar to a single disk
5	<ul style="list-style-type: none"> Also known as Block-Interleaved Distributed Parity. Data and parity information are subdivided and distributed across all disks. Parity data consumes the capacity of 2 disk drives. 	3	<ul style="list-style-type: none"> Lower than RAID 1, 1E and 6 Higher than a single drive 	<ul style="list-style-type: none"> Reads are similar to RAID 0. Writes are slower than a single disk. 	<ul style="list-style-type: none"> Reads are similar to RAID 0. Writes are slower than a single disk.
6	<ul style="list-style-type: none"> RAID 6 provides the highest reliability. Similar to RAID 5, but does two different parity computations. RAID 6 offers fault tolerance greater than RAID 1 or RAID 4. Parity data consumes the capacity of 2 disk drives. 	4	Highest reliability	<ul style="list-style-type: none"> Reads are similar to RAID 0. Writes are slower than a single disk. 	<ul style="list-style-type: none"> Reads are similar to RAID 0. Writes are slower than a single disk.

1.2 RAID Set

A RAID set is a group of disks connected to a RAID controller. A RAID set contains one or more volume sets. The RAID set itself does not define the RAID level; the RAID level is defined within each volume set. So, volume sets are contained within RAID sets and the RAID level is defined within the volume set. If physical disks of different capacities are grouped together in a RAID set, then the capacity of the smallest disk will become the effective capacity of all the disks in the RAID set.

1.3 Volume Set

Each volume set is seen by the host system as a single logical device (i.e., a single large virtual hard disk). A volume set will use a specific RAID level, which will require one or more physical disks (depending on the RAID level used). RAID level refers to the level of performance and data protection of a volume set. The capacity of a volume set can consume all or a portion of the available disk capacity in a RAID Set. Multiple volume sets can exist in a RAID Set.

For the RAID Controller, a volume set must be created either on an exiting RAID Set or on a group of available individual disks (that will become part of a RAID Set). If there are pre-existing RAID Sets with available capacity and enough disks for the desired RAID Level, then the volume set can be created in the existing RAID set of the user's choice.

2. BIOS Configuration

The RAID Configuration Utility is BIOS based and is used to configure RAID sets and volume sets. Because the utility resides in the RAID Controller firmware, operation is independent of any operating systems on your computer. This utility can be used to:

- Create RAID sets,
- Expand RAID sets
- Add physical drives,
- Define volume sets,
- Modify volume sets,
- Modify RAID level/stripe size,
- Define pass-through disk drives,
- Modify system functions, and
- Designate drives as hot spares.

2.1 Starting the RAID Configuration Utility

This section explains how to use the RAID Configuration Utility to configure your RAID system. The RAID Configuration Utility is designed to be user-friendly. It is a menu-driven program, residing in the firmware, which allows you to scroll through various menus and submenus and select among the predetermined configuration options.

To start the RAID configuration, follow these steps:

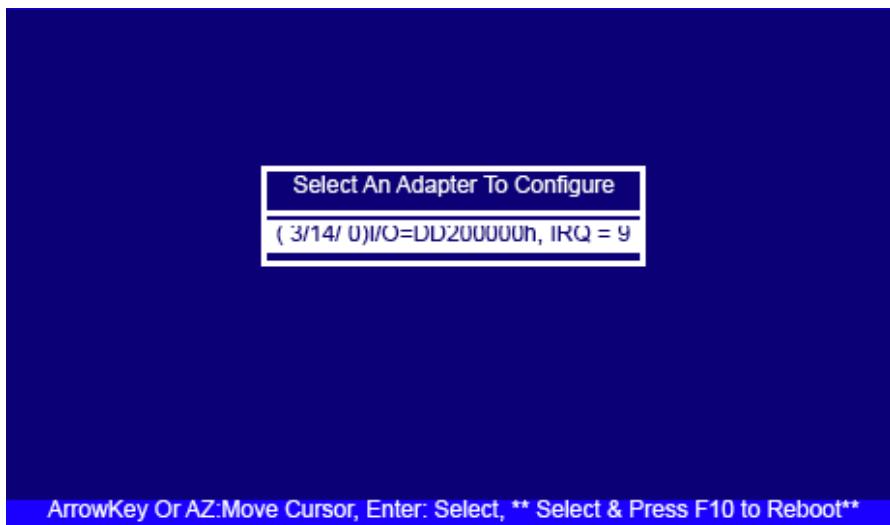

1. Turn on the GV-DVR system. It will display the following message on the monitor during the startup sequence (after the system BIOS startup screen but before the operating system boots).

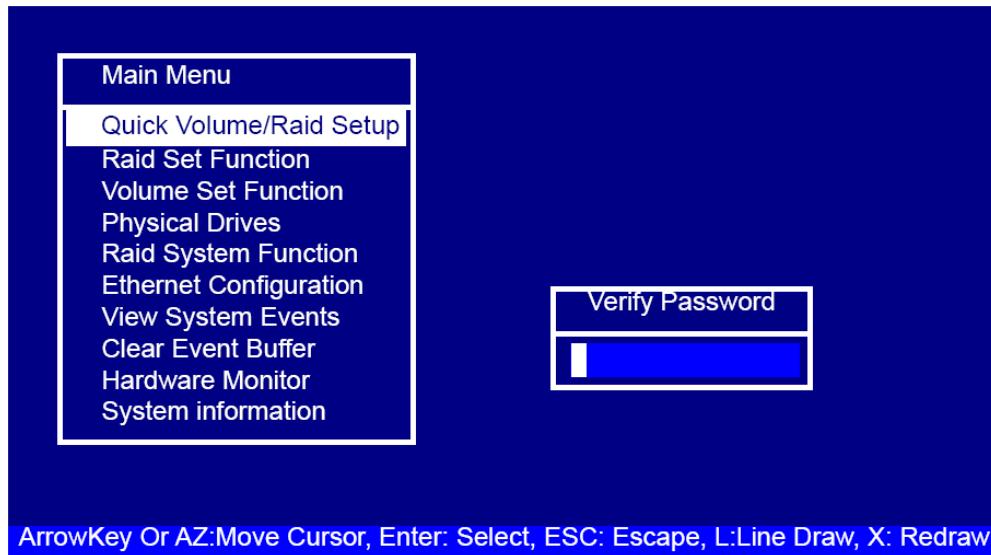

PCI-X RAID Controller – DRAM: 128 (MB) / #Channels: 8
BIOS V1.17b / Date: 2006-08-07 – F/W: V1.42 / Date: 2006-10-13

► Bus / Dev / Func = 4/14/0, I/O-Port: FDBFF000h, IRQ = 10, BIOS= CC00: 0h
►►► No BIOS disk found. RAID controller BIOS not installed!
►►► Press <Tab/F6> to enter SETUP menu. 5 second(s) left <ESC to Skip>

2. Press **TAB** or **F6** to start the RAID Configuration window. Note the message only remains on your screen for five seconds, and then it will enter the main screen of the GV-DVR system.
3. The RAID Configuration window appears and shows a dialog box listing the SATA RAID Controller that is installed in the system. Press **Enter** to enter the main menu.

4. To verify password, type the default value **Admin**.

2.2 Configuring Raid Sets and Volume Sets

With RAID Configuration Utility you can configure RAID sets and volume sets automatically using Quick Volume/Raid Setup or manually using Raid Set/Volume Set Function. Each configuration method requires a different level of user input. Generally, configuring RAID sets and volume sets proceed as follows:

Step	Action
1	Designate hot spares/pass-through drives (optional).
2	Choose a configuration method.
3	Create RAID sets using the available physical drives.
4	Define volume sets using the space available in the RAID Set.
5	Initialize the volume sets and use Volume Sets (as logical drives) in the host OS.

2.3 Designating Drives as Hot Spares

Any unused disk drive that is not part of a RAID set can be designated as a hot spare. The Quick Volume/RAID Setup configuration will add the spare disk drive and automatically display the appropriate RAID level from which the user can select. For the RAID Set Function Configuration option, you can use the Create Hot Spare option to define the hot spare disk drive.

When a hot spare disk drive is being created by the Create Hot Spare option (in the RAID Set Function), all unused physical devices connected to the current controller appear: Choose the target disk by selecting the appropriate check box. Press the **ENTER** key to select a disk drive, and press **Yes** in the Create Hot Spare to designate it as a hot spare.

2.4 Using Quick Volume /Raid Setup Configuration

Quick Volume / RAID Setup Configuration collects all available drives and includes them in a RAID set. The RAID set you created is associated with exactly one volume set. You will only be able to modify the default RAID level, the stripe size, and the capacity of the new volume set. Designating drives as Hot Spares is also possible in the raid level selection option. The Volume Set default settings will be:

Parameter	Setting
Volume Name	Volume Set # 00
SCSI Channel/SCSI ID/SCSI LUN	0/0/0
Cache Mode	Write Back
Tag Queuing	Yes

The default setting values can be changed after configuration is complete. Follow the steps below to create arrays using the RAID Set / Volume Set method:

Step	Action
1	Choose Quick Volume /Raid Setup from the main menu. The available RAID levels with hot spare for the current volume set drive are displayed.
2	It is recommended that your drives of the same capacity be put in a specific array. If you use drives with different capacities in an array, all drives in the raid set will be set to the capacity of the smallest drive in the raid set. The numbers of physical drives in a specific array determines which RAID levels that can be implemented in the array. RAID 0 requires 1 or more physical drives. RAID 1 requires at least 2 physical drives. RAID 1+Spare requires at least 3 physical drives. RAID (1+0) requires at least 4 physical drives. RAID 3 requires at least 3 physical drives. RAID 5 requires at least 3 physical drives. RAID 3 +Spare requires at least 4 physical drives. RAID 5 + Spare requires at least 4 physical drives. RAID 6 requires at least 4 physical drives. RAID 6 + Spare requires at least 5 physical drives. Highlight the desired RAID level for the volume set and press the ENTER key to confirm.
3	The capacity for the current volume set is entered after highlighting the desired RAID level and pressing the ENTER key. The capacity for the current volume set is displayed. Use the UP and DOWN arrow keys to set the capacity of the volume set and press the ENTER key to confirm. The available stripe sizes for the current volume set are then displayed.

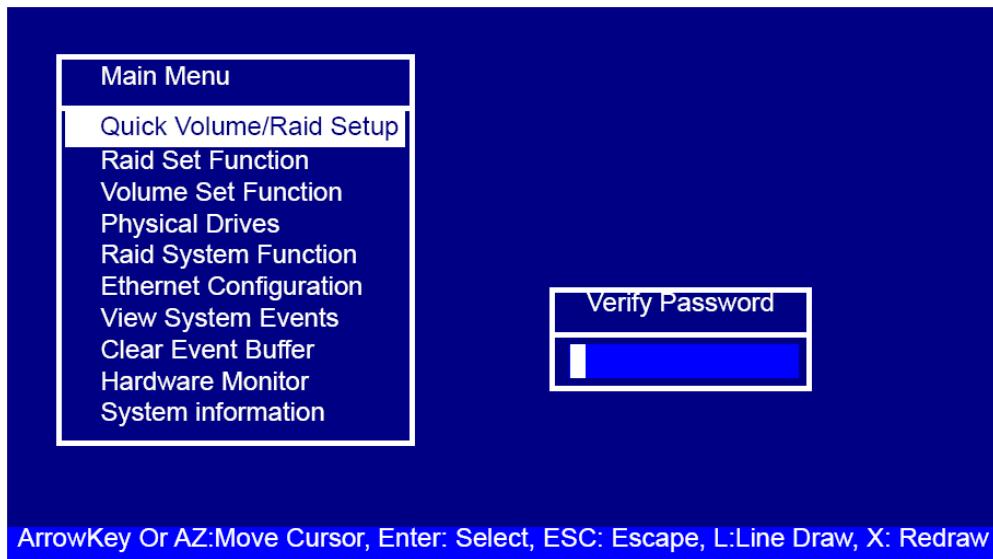

4	Use the UP and DOWN arrow keys to select the current volume set stripe size and press the ENTER key to confirm. This parameter specifies the size of the stripes written to each disk in a RAID 0, 1, 5 or 6 Volume Set. You can set the stripe size to 4 KB, 8 KB, 16 KB, 32 KB, 64 KB, or 128 KB. A larger stripe size provides better read performance, especially when the computer performs mostly sequential reads. However, if the computer performs random read requests more often, choose a smaller stripe size.
5	When you are finished defining the volume set, press the ENTER key to confirm the Quick Volume And Raid Set Setup function.
6	Foreground (Fast Completion) Press the ENTER key to define fast initialization or Selected the Background (Instant Available). In the background Initialization, the initialization proceeds as a background task, the volume set is fully accessible for system reads and writes. The operating system can instantly access to the newly created arrays without requiring a reboot and waiting the initialization complete. In Fast Initialization, the initialization proceeds must be completed before the volume set ready for system accesses.
7	Initialize the volume set you have just configured.
8	If you need to add additional volume set, using main menu Create Volume Set function.

Note: A user can use this method to examine the existing configuration. The “modify volume set configuration” method provides the same functions as the “create volume set configuration” method. In the volume set function, you can use “modify volume set” to change all volume set parameters except for capacity (size).

3. Main Menu of BIOS Configuration

The main menu shows all functions that are available for executing actions, which is accomplished by clicking on the appropriate link.

Note: The manufacture default password is set to **ADMIN**; this password can be modified by selecting **Change Password** in the RAID System Function section.

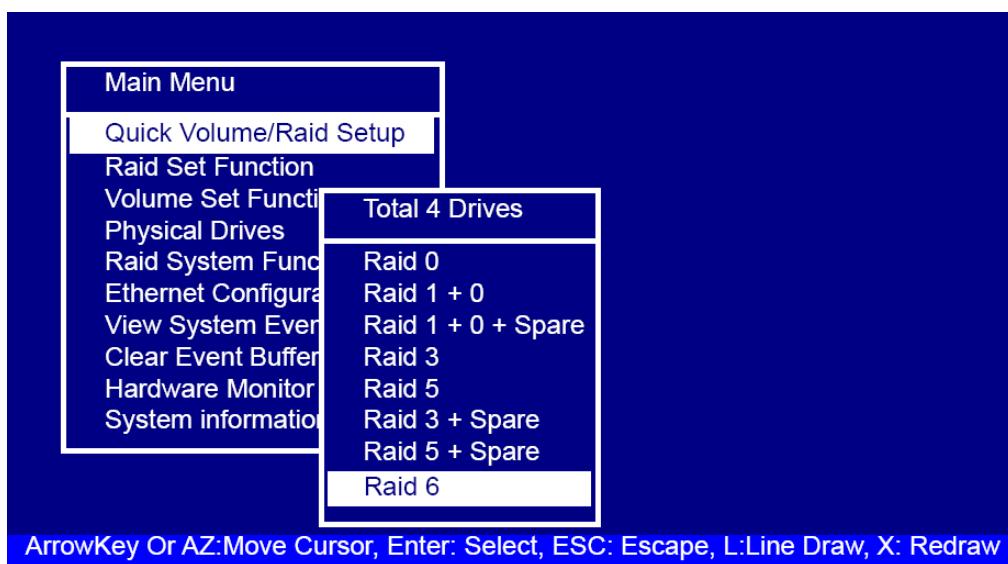

Option	Description
Quick Volume/RAID Setup	Create a default configuration based on the number of physical disk installed
RAID Set Function	Create a customized RAID set
Volume Set Function	Create a customized volume set
Physical Drives	View individual disk information
RAID System Function	Setup the RAID system configuration
Ethernet Configuration	Feature not available
View System Events	Record all system events in the buffer
Clear Event Buffer	Clear all information in the event buffer
Hardware Monitor	Show the hardware system environment status

3.1 Quick Volume/RAID Setup

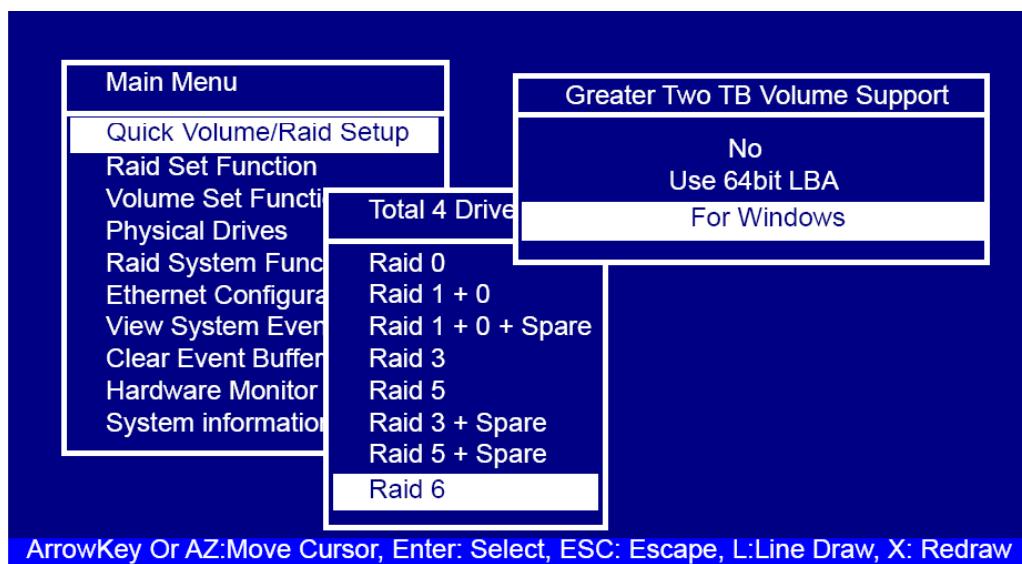

“Quick Volume/RAID Setup” is the fastest way to prepare a RAID set and a volume set. It requires only a few keystrokes to complete. Although disk drives of different capacity may be used in the RAID set, it will use the capacity of the smallest disk drive as the capacity of all disk drives in the RAID set. The Quick Volume/ RAID Setup option creates a RAID set with the following properties:

- All of the physical drives are contained in one RAID set.
- The RAID level, hot spare, capacity, and stripe size options are selected during the configuration process.
- When a single volume set is created, it can consume all or a portion of the available disk capacity in this RAID set.
- If you need to add an additional volume set, use the “Create Volume Set” option in main menu.

The total numbers of physical drives in a specific RAID set determine the RAID levels that can be implemented within the RAID set. Select **Quick Volume/RAID Setup** from the main menu; all possible RAID levels will be displayed on the screen.

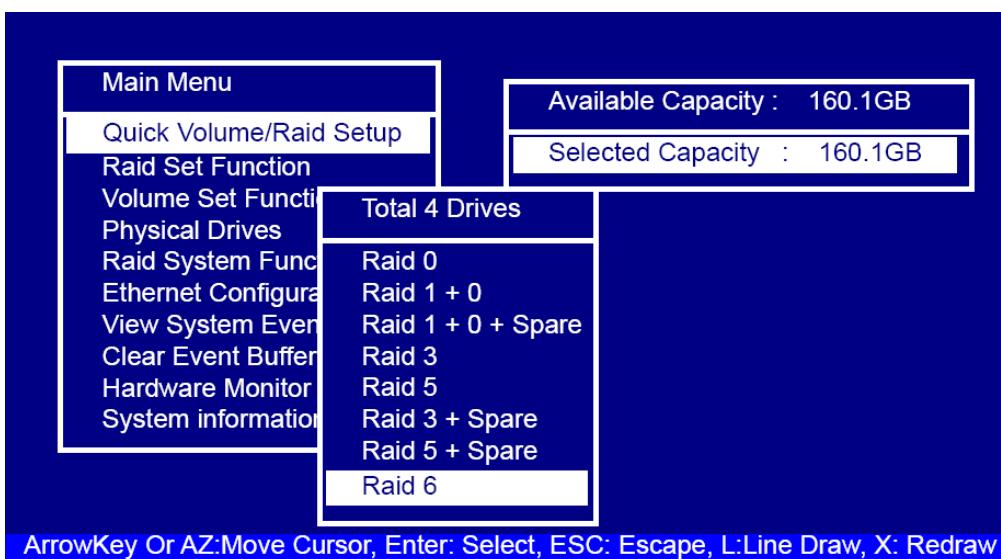

If the volume capacity exceeds 2 TB, the controller will show the “Greater 2 TB Volume Support” sub-menu.

- **No:** It keeps the volume size with max. 2 TB limitation.
- **Use 64bit LBA:** This option **CAN NOT** work on the GV-DVR System, because this option works on different OS that supports 16 bytes CDB.
- **For Windows:** It changes the sector size from default 512 Bytes to 4 K Bytes. The maximum volume capacity is up to 16 TB.

This option works under Windows platform only. And it **CAN NOT** be converted to Dynamic Disk, because 4k sector size is not a standard format.

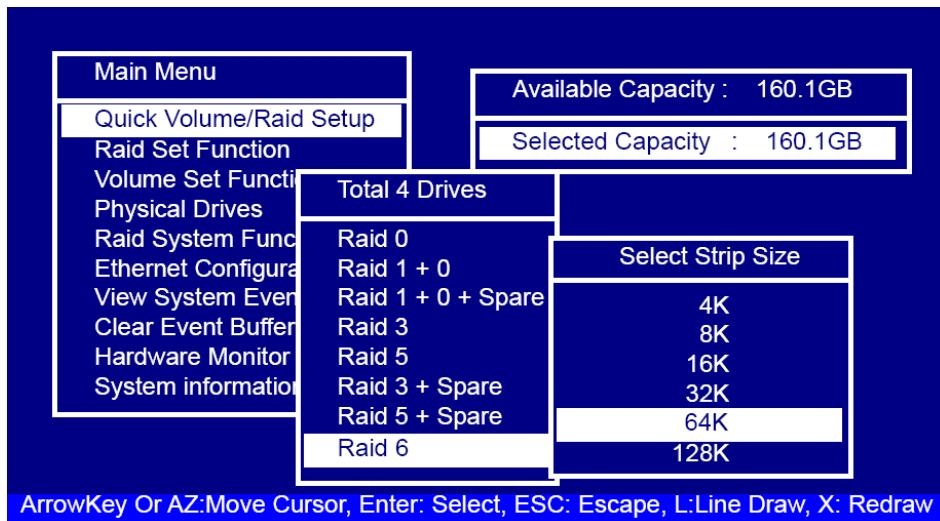

A single volume set is created and consumes all or a portion of the disk capacity available in this RAID set. Define the capacity of volume set in the Available Capacity popup. The default value for the volume set, which is 100% of the available capacity, is displayed in the selected capacity. To enter a value less than the available capacity, use **UP** and **DOWN** arrow keys to select the specific capacity and press the **ENTER** key to accept this value. If the volume set uses only part of the RAID set capacity, you can use the **Create Volume Set** option in the main menu to define additional volume sets.

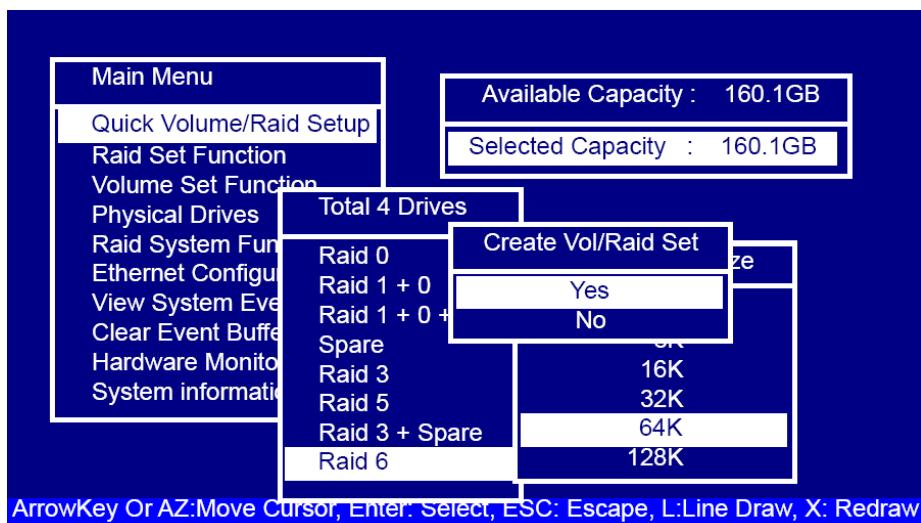

Stripe size

This parameter sets the size of the stripe written to each disk in a RAID 0, 1, 5, or 6 logical drive. You can set the stripe size to 4 KB, 8 KB, 16 KB, 32 KB, 64 KB, or 128 KB. A larger stripe size produces better-read performance, especially if your computer does mostly sequential reads. However, if you are sure that your computer performs random reads more often, select a smaller stripe size.

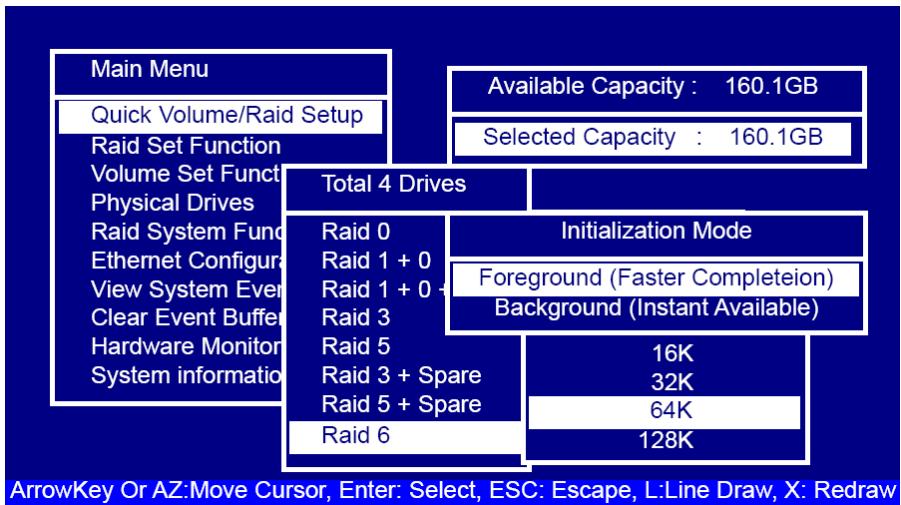

3 Main Menu of BIOS Configuration

Select **Yes** in the Create Vol/RAID Set dialog box, the RAID set and volume set will start to initialize.

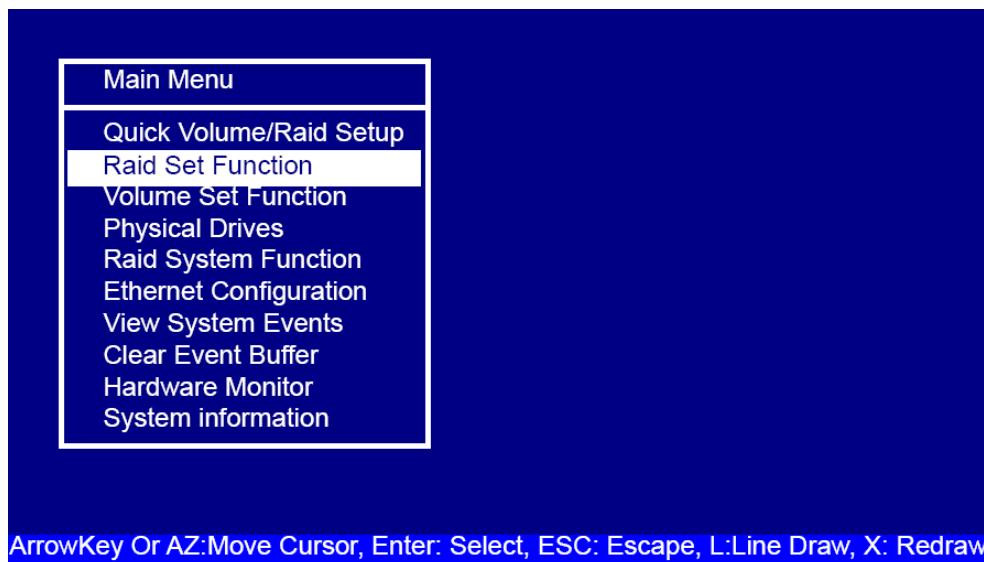

Select **Foreground (Faster Completion)** or **Background (Instant Available)** for initialization.

3.2 RAID Set Function

Manual configuration gives complete control of the RAID set setting, but it will take longer to configure than “Quick Volume/RAID Setup”. Select **RAID Set Function** to manually configure the RAID set for the first time, or delete existing RAID sets and reconfigure the RAID set.

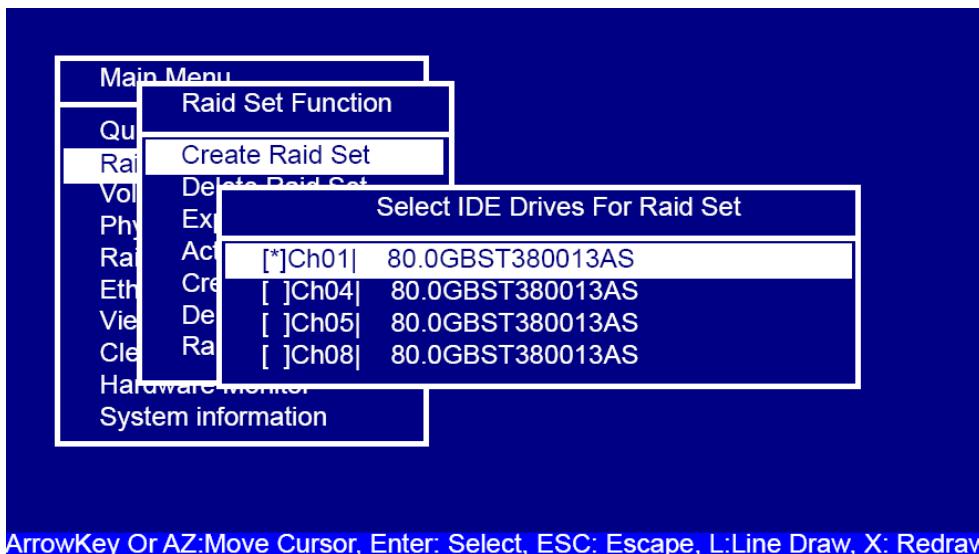

3.2.1 Create RAID Set

To define a RAID set, follow these steps:

1. Select **RAID Set Function** from the main menu.
2. Select **Create RAID Set**. A Select SATA Drive For RAID Set window appears, showing the SATA drives connected to the current controller.

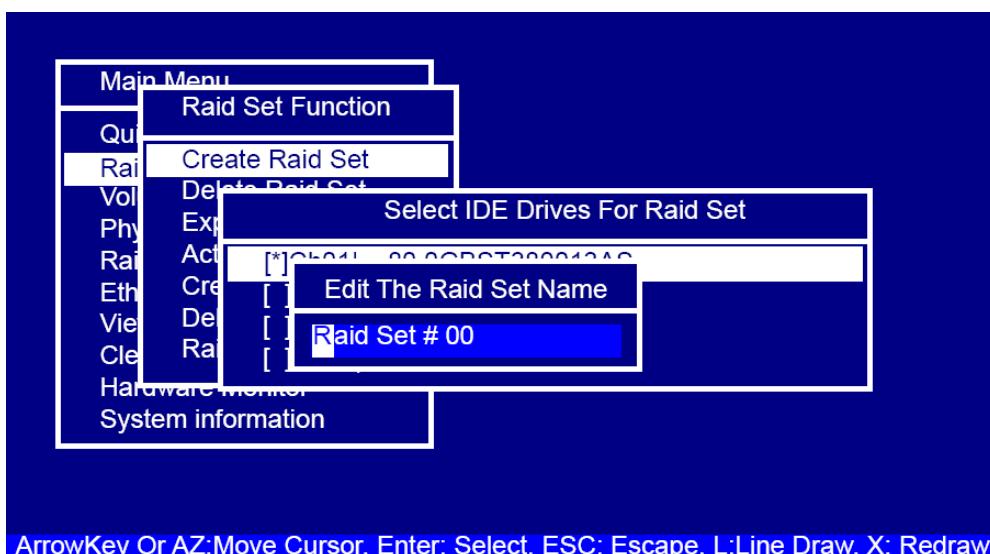

3. Press the **UP ARROW** and **DOWN ARROW** keys to select specific physical drives. Press the **ENTER** key to associate the selected physical drive with the current RAID set. Repeat this step; the user can add as many disk drives as are available to a single RAID set.

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

4. When you finish selecting SATA drives for RAID set, press the **ESC** key. A Create RAID Set confirmation screen appears, select **Yes** to confirm it.

5. The Edit The RAID Set Name dialog box appears, enter 1 to 15 alphanumeric characters to define a unique identifier for the RAID set. The default RAID set name will always appear as “RAID Set. #”.

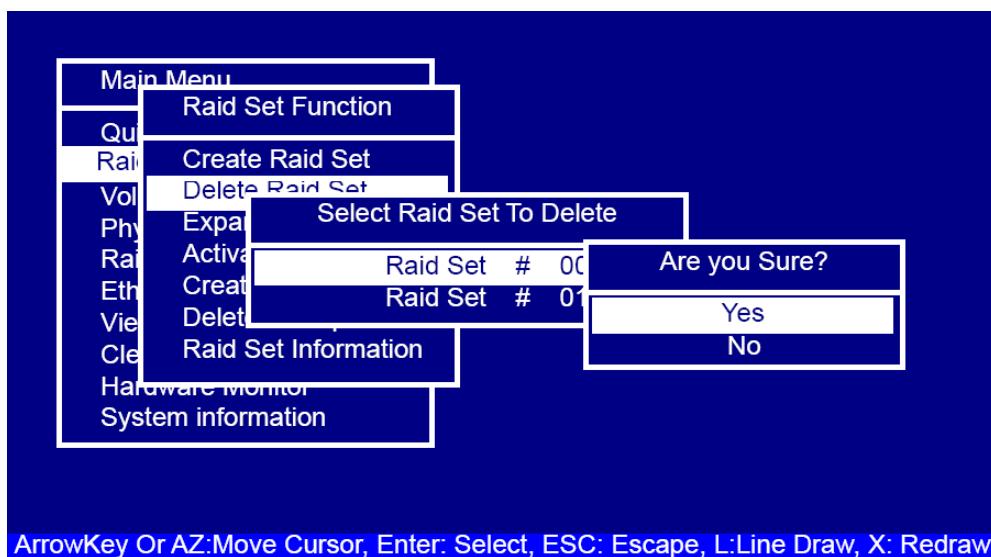

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

3.2.2 Delete RAID Set

To completely erase and reconfigure a RAID set, you must first delete it and re-create the RAID set.

To delete a RAID set, select the RAID set number that the user wants to delete in the Select RAID Set to Delete screen. When the Delete RAID Set dialog box appears, press **Yes** key to delete it.

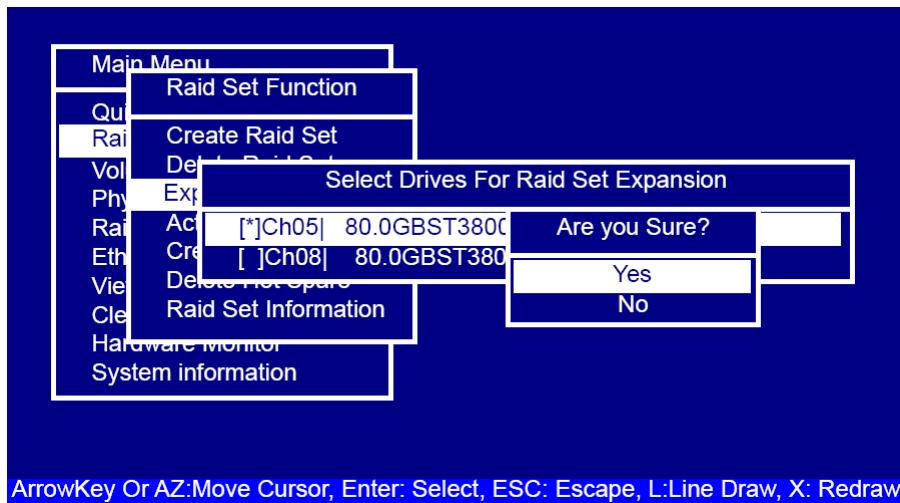

Warning: Data on the RAID set will be lost if this option is used.

3.2.3 Expand RAID Set

Instead of deleting a RAID set and recreating it with additional disk drives, the Expand RAID Set function allows the user to add disk drives to the RAID set that has already been created. To expand a RAID set, follow these steps:

1. Select the **Expand RAID Set** option. If there is an available disk, the Select SATA Drives For RAID Set Expansion screen will appear.
2. Select the target RAID set by clicking on the appropriate radio button. Select the target disk by selecting the appropriate check box.
3. Press **Yes** to start expansion of the RAID set.

The new additional capacity can be utilized by one or more volume sets. Follow the instruction presented in the Volume Set Function to modify the volume sets; operation system specific utilities may be required to expand operating system partitions.

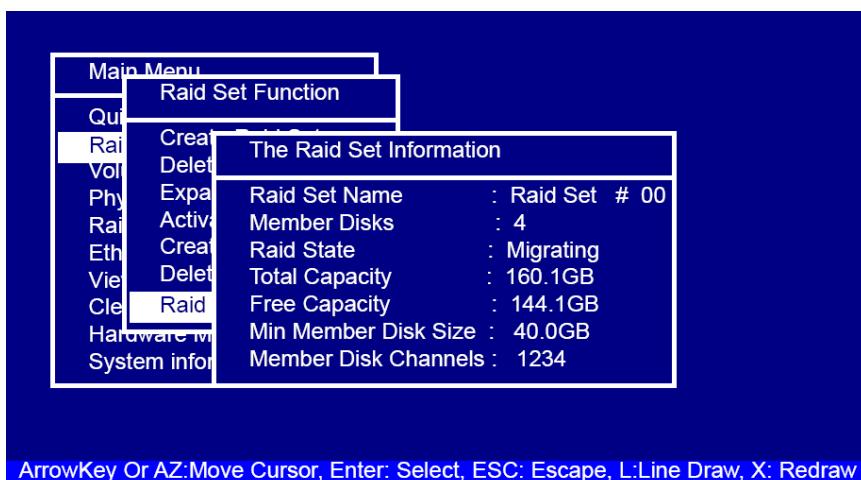

Note:

1. Once the Expand RAID Set process has started, the user cannot stop it. The process must be completed.
2. If a disk drive fails during RAID set expansion and a hot spare is available, an auto rebuild operation will occur after the RAID set expansion completes.

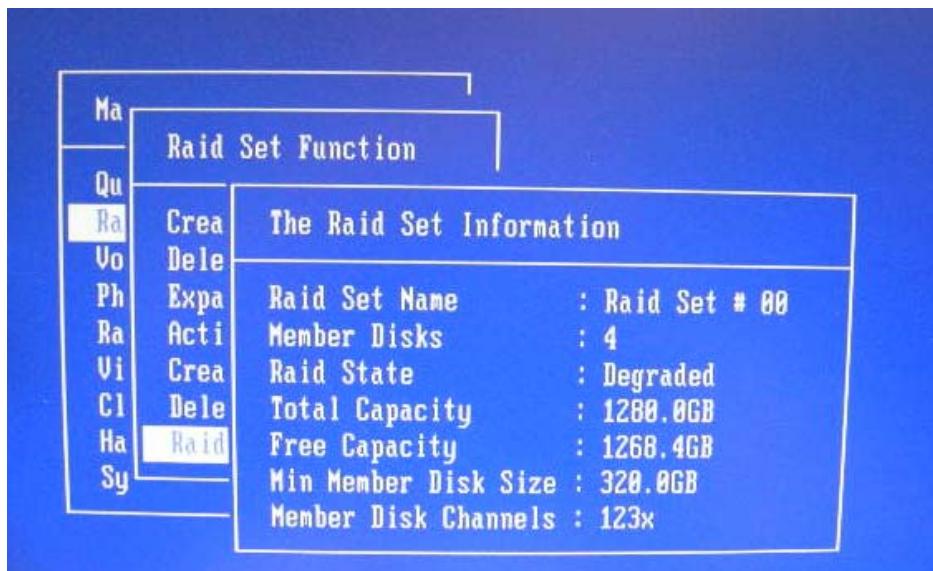

Migrating

Migration occurs when a disk is added to a RAID set. Migration status is displayed in the RAID Set information screen when a disk is being added to a RAID set. Migrating status is also displayed in the associated Volume State area of the Volume Set Information screen when a disk is added to a RAID set.

3.2.4 Activate Incomplete RAID Set

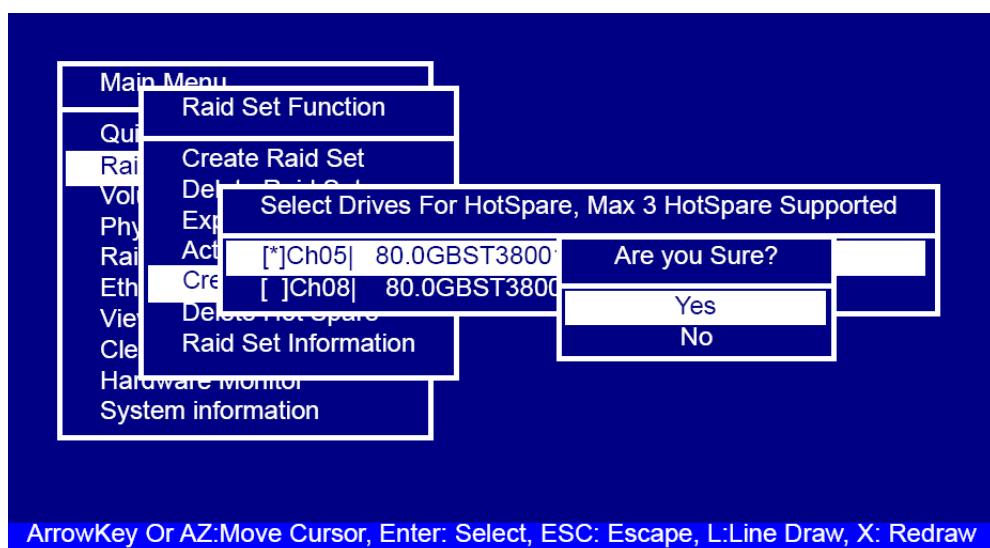

When one of the disk drives is removed in power off state, the RAID State will change to Incomplete State. If a user wants to continue to work while the RAID Controller is powered on, the user can use the Activate RAID Set option to activate the RAID set. After the user selects this function, the RAID State will change to Degraded Mode.

3.2.5 Create Hot Spare

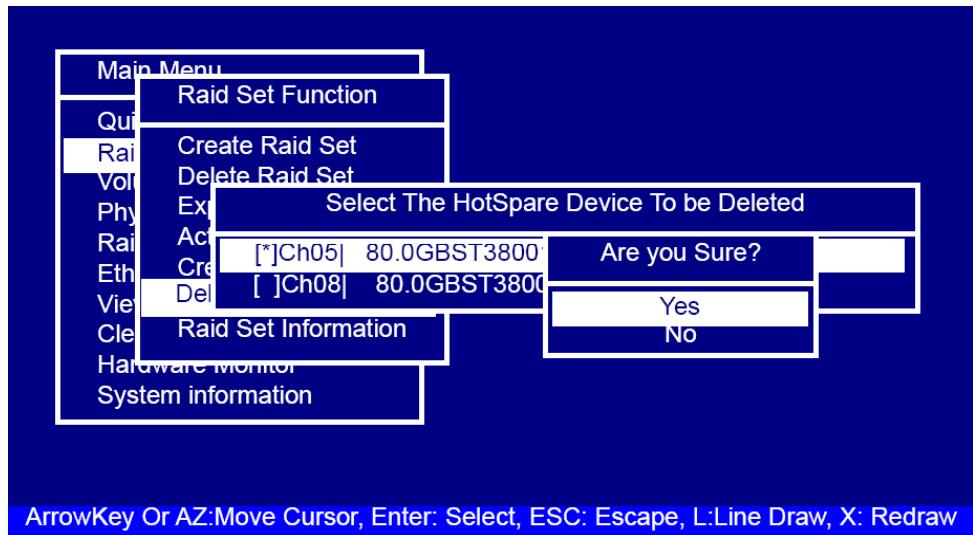

The Create Hot Spare option allows you to define a global hot spare. When you choose this option in the RAID Set Function, all unused physical devices connected to the current controller will appear. To create a hot spare, follow these steps:

To create a hot spare, select the target disk by selecting the appropriate check box. Press the **ENTER** key to select a disk drive, and press **Yes** to designate it as a hot spare.

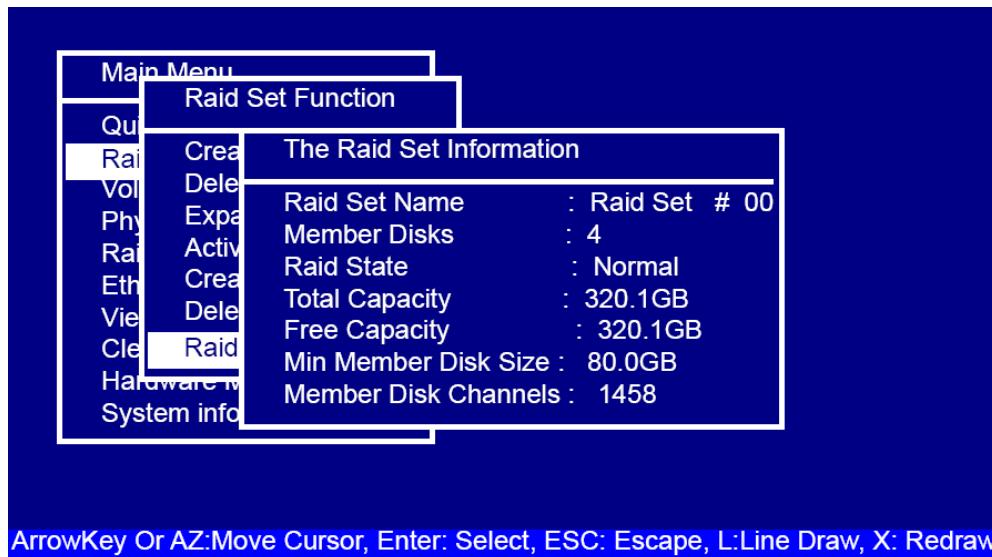

3.2.6 Delete Hot Spare

To delete a hot spare, select the target hot spare disk to delete by selecting the appropriate check box. Press the **ENTER** key to select a disk drive, and press **Yes** to delete the hot spare.

3.2.7 RAID Set Information

To display RAID Set information, select the desired RAID Set number, and press the **ENTER** key. The RAID Set Information will display. You can only view the information of the RAID set in this screen, not modify it.

3.3 Volume Set Function

A volume set is seen by the host system as a single logical device; it is organized in a RAID level within the controller utilizing one or more physical disks. RAID level refers to the level of data performance and protection of a volume set. A volume set can consume all of the capacity or a portion of the available disk capacity of a RAID set. Multiple volume sets can exist on a RAID set. If multiple volume sets reside on a specified RAID Set, all volume sets will reside on all physical disks in the RAID set. Thus each volume set on the RAID set will have its data spread evenly across all the disks in the RAID set rather than one volume set using some of the available disks and another volume set using other disks.

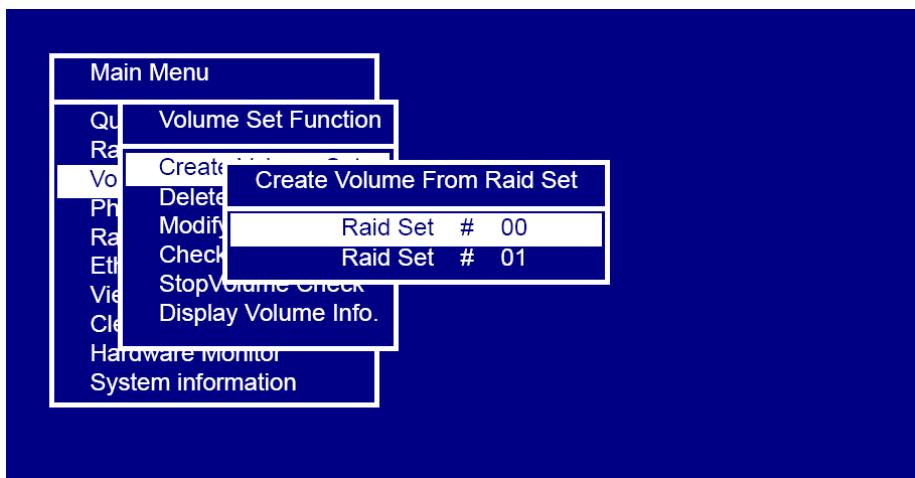

3.3.1 Create Volume Set

The Create Volume Set option creates a volume set with the following properties:

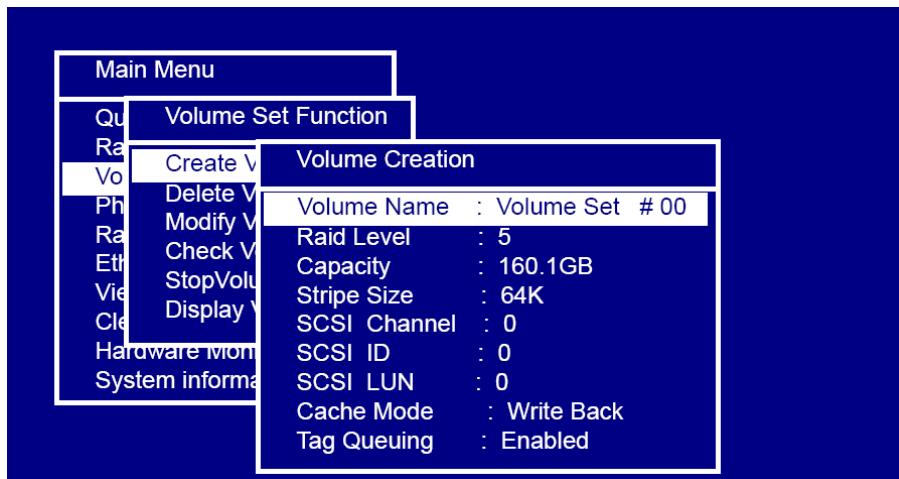

- Volume sets of different RAID levels may coexist on the same RAID set.
- Up to 16 volume sets in a RAID set can be created by the SATA RAID controller.
- The maximum addressable size of a single volume set is not limited to 2 TB as with other cards that support only 32-bit mode.

To create a volume set, follow these steps:

1. Select **Volume Set Function** from the main menu.
2. Select **Create Volume Set**, and press the **ENTER** key. The Create Volume From RAID Set dialog box appears. This screen displays the existing arranged RAID sets.

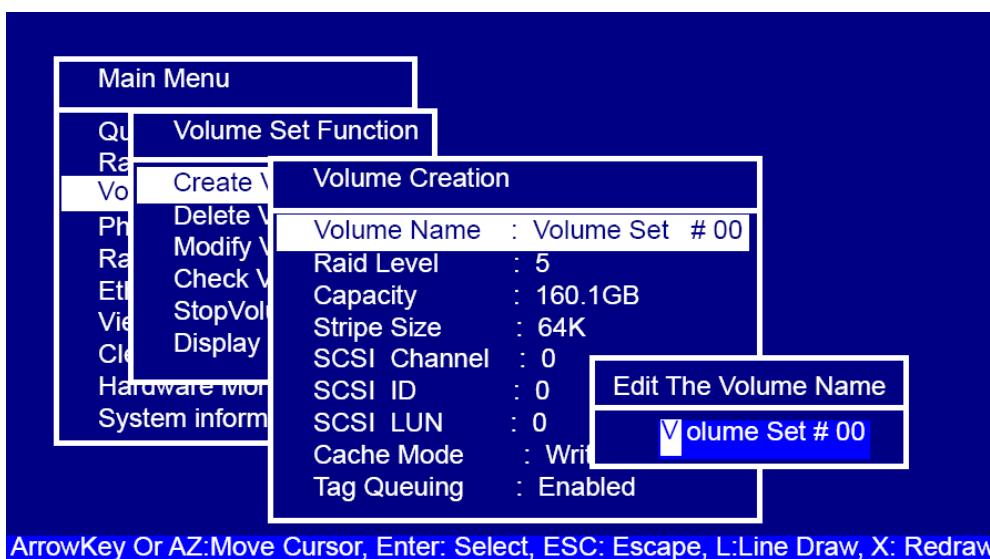

3. Select the RAID set number, and press the **ENTER** key. The “Volume Creation” dialog box appears. This screen displays a summary of the current volume set’s settings.

4. You can modify the default values of the volume name, capacity, RAID level, stripe size, disk info, cache mode and tag queuing.
5. After completing the modification of the volume set, press the **ESC** key to confirm it. The "Initialization Mode" dialog box appears.
6. Select **Foreground (Faster Completion)** for faster initialization of the selected volume set. Select **Background (Instant Available)** for normal initialization of the selected volume set.
7. Repeat Steps 3 to 6 to create additional volume sets.
8. The initialization percentage of volume set will be displayed at the button line.

Volume Name

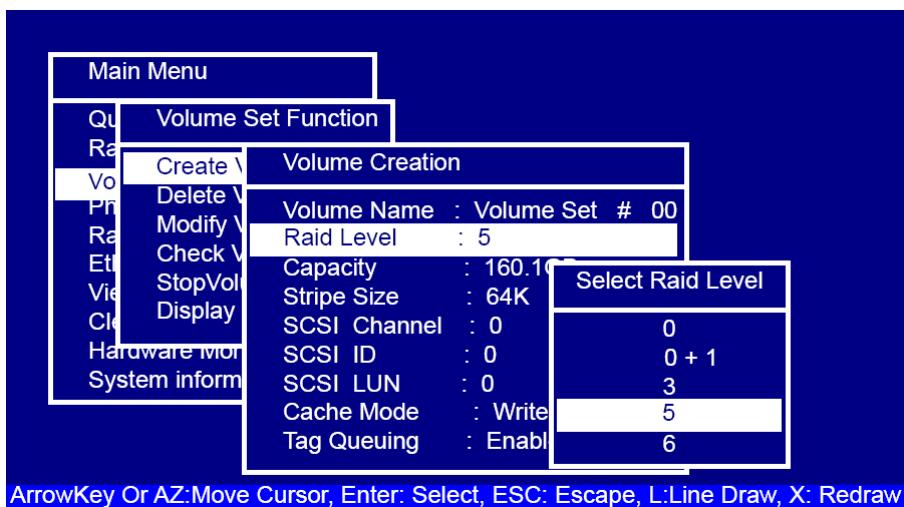

The default volume name will always appear as "Volume Set #". You can rename the volume set providing it does not exceed the limit of 15 characters.

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

RAID Level

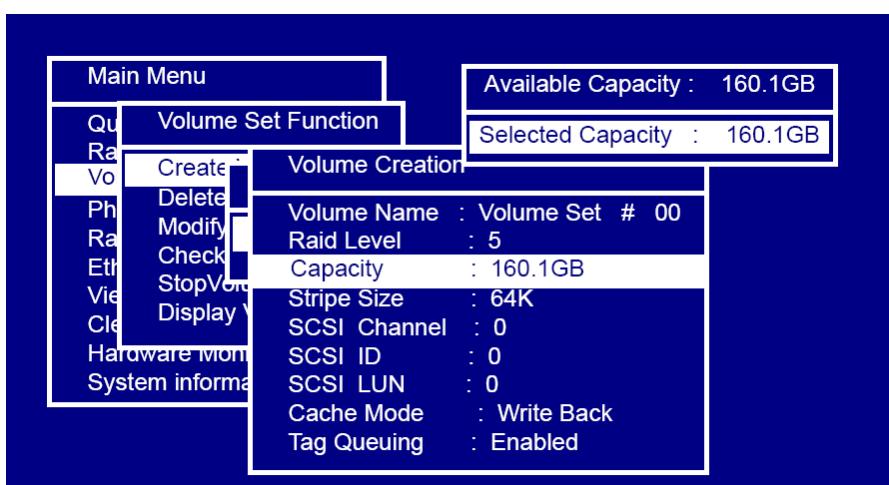

Set the RAID level for the volume set. Highlight **RAID Level** and press the **ENTER** key. The available RAID levels for the current volume set will appear. Select a RAID level and press the **ENTER** key to confirm.

Capacity

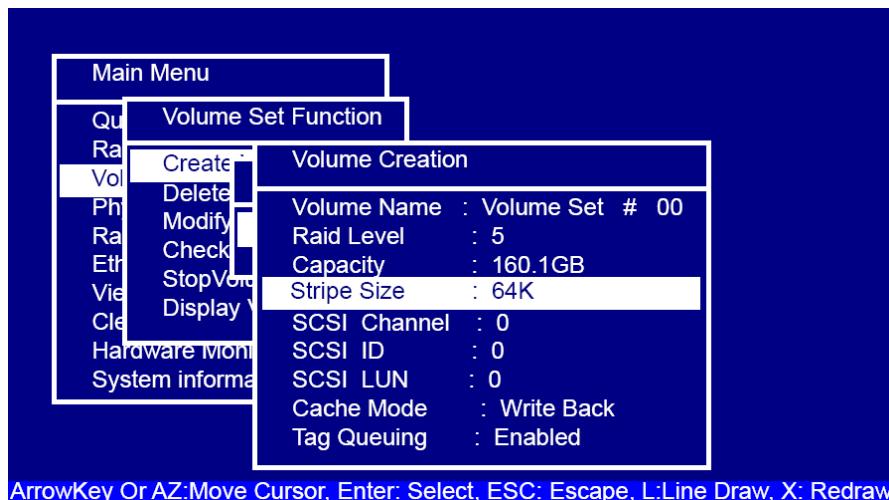

The maximum available volume size is the default value for the first setting. Enter the appropriate volume size to fit your application. The capacity value can be increased or decreased by the **UP** and **DOWN** arrow keys. The capacity of each volume set must be less than or equal to the total capacity of the RAID set on which it resides.

If the volume capacity exceeds 2 TB, the controller will show the “Greater 2 TB Volume Support” sub-menu. Select **No** to keep the volume size with the limitation of 2 TB. Or select **For Windows** to have the volume capacity up to 16 TB. Refer to the same sub-menu in 3.1 *Quick Volume/RAID Setup*.

Stripe Size

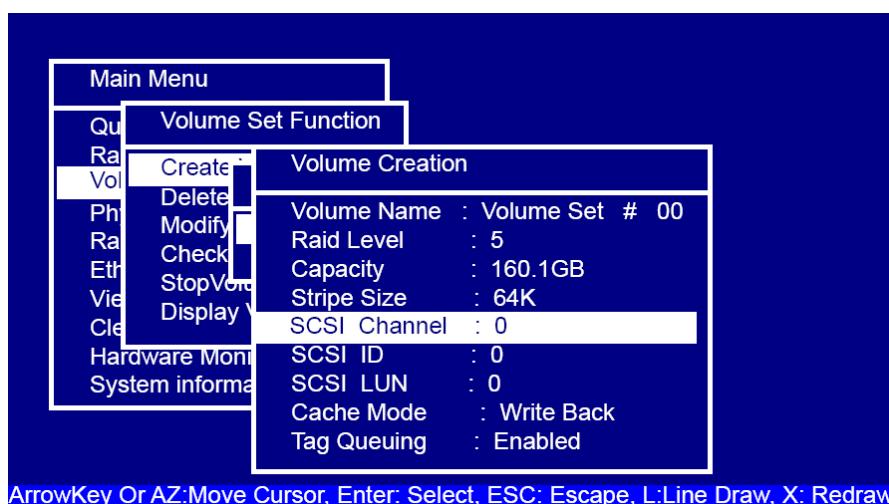

This parameter sets the size of the segment written to each disk in a RAID 0, 1, 5, or 6 logical drive. You can set the stripe size to 4 KB, 8 KB, 16 KB, 32 KB, 64 KB, or 128 KB.

SCSI Channel / SCSI ID / SCSI LUN

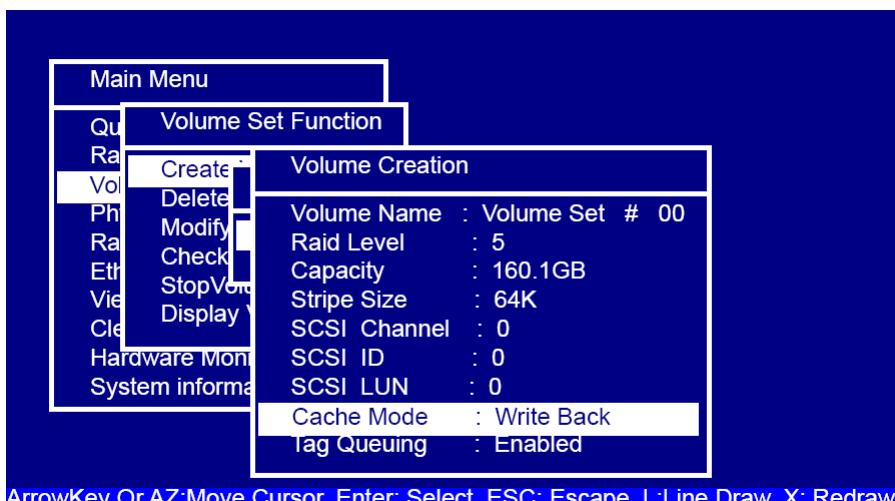

Keep the default values in these three options.

- **SCSI Channel:** The RAID Controller function simulates a SCSI RAID controller. The host bus represents the SCSI channel.
- **SCSI ID:** Each device attached to the SATA card, as well as the card itself, must be assigned a unique SCSI ID number. A SCSI channel can connect up to 15 devices.
- **SCSI LUN:** Each SCSI ID can support up to 8 LUNs. Most SCSI controllers treat each LUN as if it were a SCSI disk.

Cache Mode

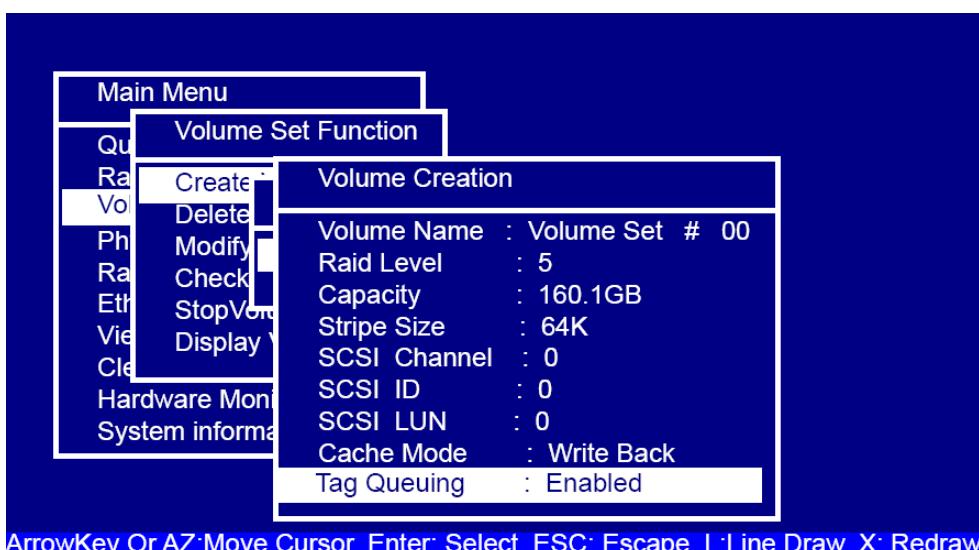

The user can set the cache mode to either **Write-Through** or **Write-Back**.

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

Tag Queuing

This option, when enabled, can enhance overall system performance under multi-tasking operating systems. The Command Tag (Drive Channel) function controls the SCSI command tag queuing support for each drive channel. This function should normally remain enabled. Disable this function only when using older drives that do not support command tag queuing.

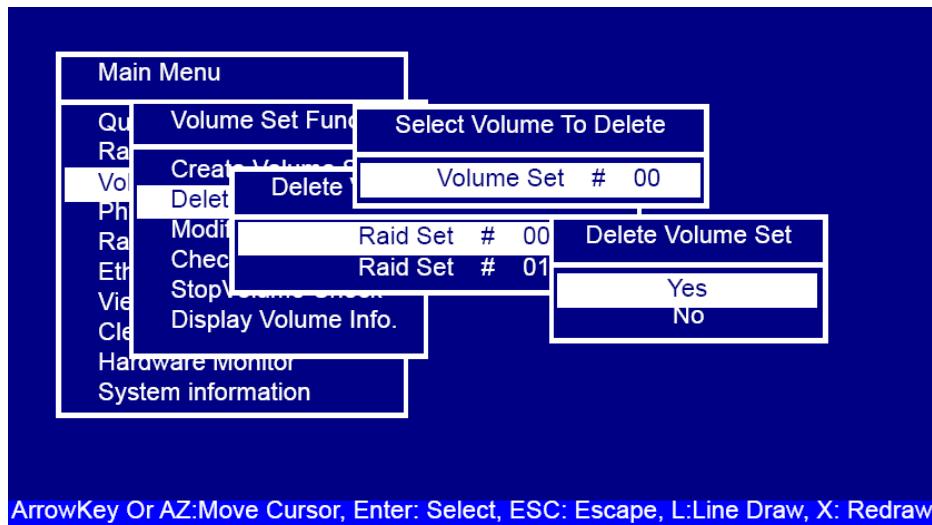

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

3.3.2 Delete Volume Set

To delete a volume set, follow these steps:

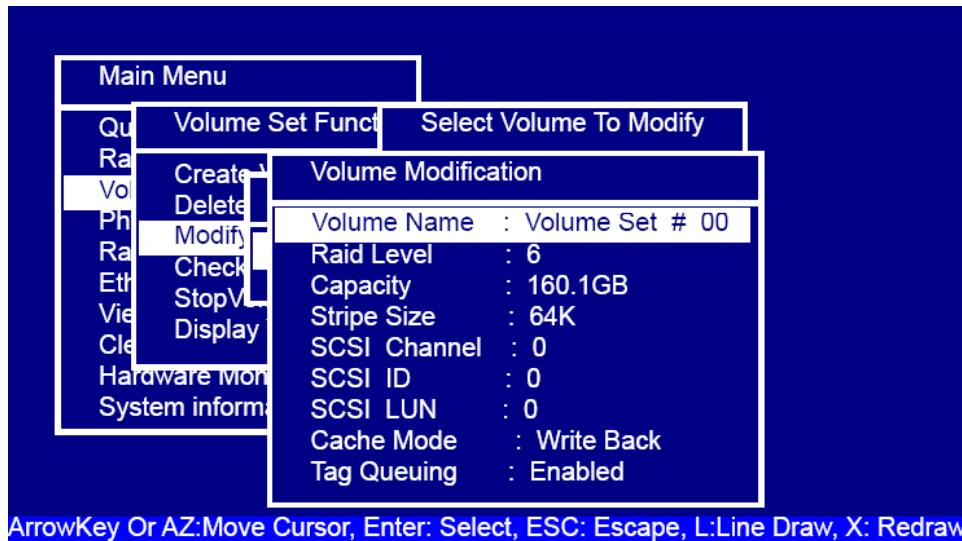

1. Select **Volume Set Function** from the main menu.
2. Select **Delete Volume Set**, and press the **ENTER** key. All RAID Set # items appear.
3. Select a RAID Set number, and press the **ENTER** key. All Volume Sets within that RAID set appear.
4. Select the Volume Set number that is to be deleted, and press the **ENTER** key to delete it.

3.3.3 Modify Volume Set

To modify a volume set, follow these steps:

1. Select **Volume Set Function** from the main menu.
2. Select **Modify Volume Set**, and press the **ENTER** key. All RAID Set # items appear.
3. Select a RAID Set number, and press the **ENTER** key. All Volume Set items within that RAID set appear.
4. Select the Volume Set that is to be changed, and press the **ENTER** key.
5. The properties of the selected Volume Set appear. All values can be modified except the capacity.

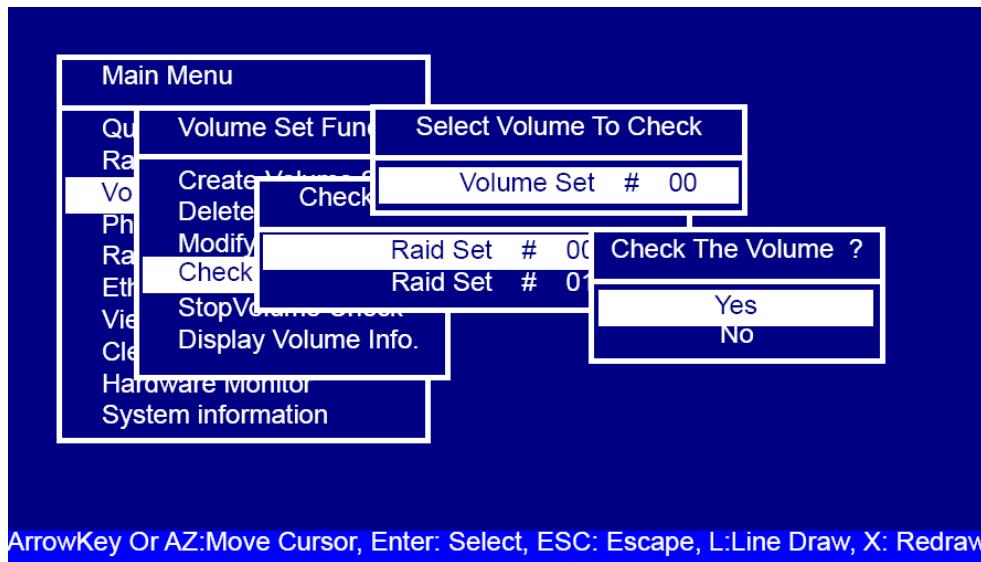

3.3.4 Check Volume Set

Use this option to verify the correctness of the redundant data in a volume set. For example, in a system with a dedicated parity disk drive, a volume set check entails computing the parity of the data disk drives and comparing those results to the contents of the dedicated parity disk drive. To check the volume set, follow these steps:

1. Select **Volume Set Function** from the main menu.
2. Select **Check Volume Set**, and press the **ENTER** key. All RAID Set # items appear.
3. Select a RAID Set number, and press the **ENTER** key. All Volume Set items within that RAID set appear.
4. Select the Volume Set that is to be checked, and press the **ENTER** key to start the check.

3.3.5 Stop Volume Set Check

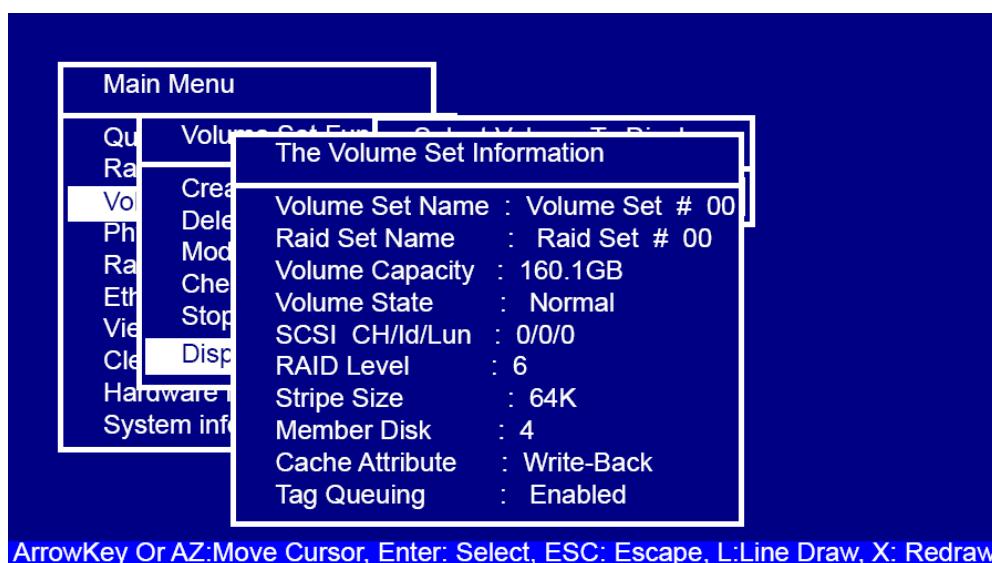

Use this option to stop all of the Check Volume Set operations.

3.3.6 Display Volume Set Info.

To display Volume Set information, follow these steps:

1. Select the desired Volume Set number and then press the **ENTER** key.
2. The Volume Set Information will be shown. You can only view the information of this Volume Set on this screen, not modify it.

3.4 Physical Drives

Choose this option from the main menu to select a physical disk and perform the operations listed above.

3.4.1 View Drive Information

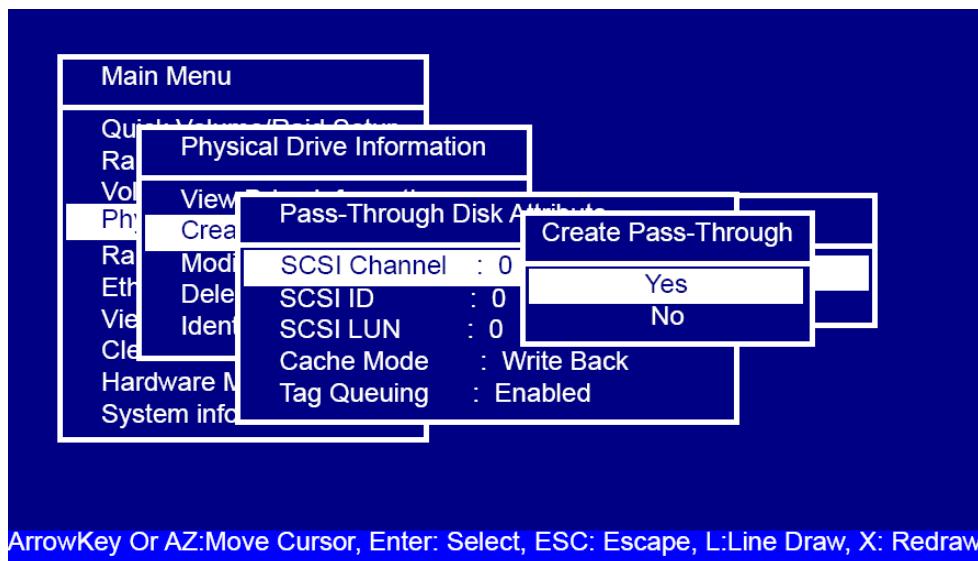

When you choose this option, the physical disks connected the SATA RAID controllers are listed. Select the desired drive and press the **ENTER** key to view drive information.

Ma	Phys	Ch01
Qu	View	Model Name : ST380013AS
Ra	Crea	Serial Number : 5JV944ZF
Vo	Modi	Firmware Rev. : 3.18
Ph	Dele	Disk Capacity : 80.0 GB
Ra	Ident	PIO Mode : Mode 4
Eth		Current UDMA : SATA150(6)
		Supported UDMA : SATA150(6)
		Device State : RaidSet Member
		Timeout Count : 0
		Media Errors : 0
		SMART Read Error Rate : 200 (51)
		SMART Spinup Time : 173 (21)
		SMART Reallocation Count : 200 (140)
		SMART Seek Error Rate : 200 (51)
		SMART Spinup Retries : 100 (51)
		SMART Calibration Retries : 100 (51)

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

3.4.2 Create Pass-Through Disk

A Pass-Through Disk is not controlled by the SATA RAID Controller firmware and thus cannot be a part of a volume set. The disk is available directly to the operating system as an individual disk. It is typically used on a system where the operating system is on a disk not controlled by the SATA RAID Controller firmware. The SCSI Channel, SCSI ID, SCSI LUN, Cache Mode, and Tag Queuing must be specified to create a pass-through disk.

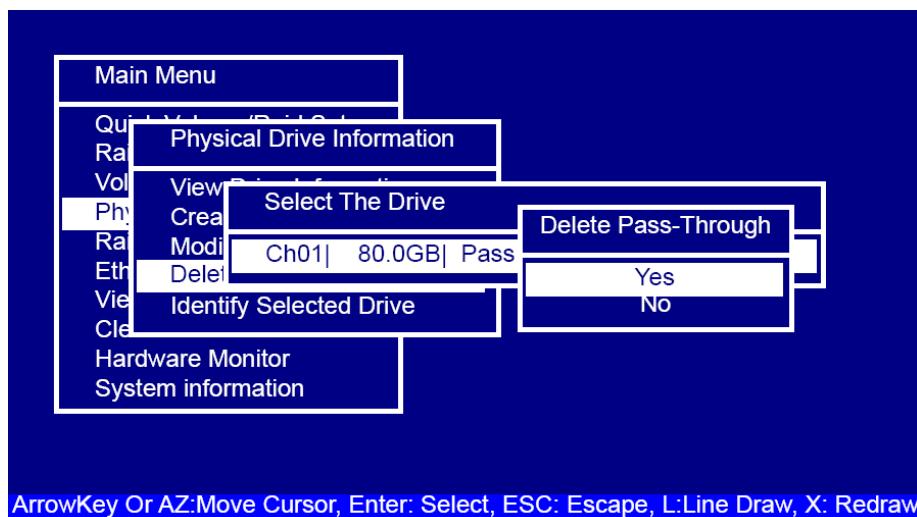

3.4.3 Modify a Pass-Through Disk

To modify a pass-through disk from the pool of pass-through disks, follow these steps:

1. Select **Physical Drive** from the main menu.
2. Select **Modify Pass-Through Drive**, and press the **ENTER** key. All RAID Pass-Through Drive number options appear.
3. Select the desired item, and press the **ENTER** key. The Pass-Through Attribute appears.
4. Select the parameter from the list to be change, and press the **ENTER** key to modify it.

3.4.4 Delete Pass-Through Disk

To delete a Pass-through drive from the Pass-through drive pool, select **Physical Drive** from the main menu, select **Delete Pass-Through Drive**, and then press the **ENTER** key. The Delete Pass-Through confirmation screen will appear; select **Yes** to delete it.

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

3.4.5 Identify Selected Drive

To prevent removing the wrong drive, the selected disk HDD LED Indicator will light for physically locating the selected disk when the Identify Selected Device is selected.

This feature is **not available** on the GV-DVR system.

3.5 RAID System Function

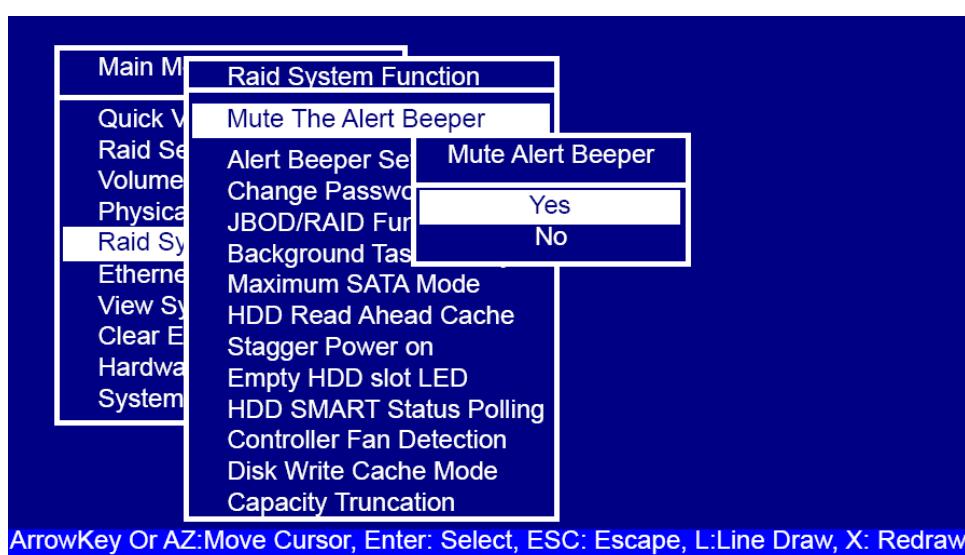

Select this option from the main menu to set the RAID system functions.

3.5.1 Mute The Alert Beeper

The Mute Alert Beeper option is used to control the RAID Controller beeper.

Select **Yes** and press the **ENTER** key in the dialog box to turn the beeper off temporarily.

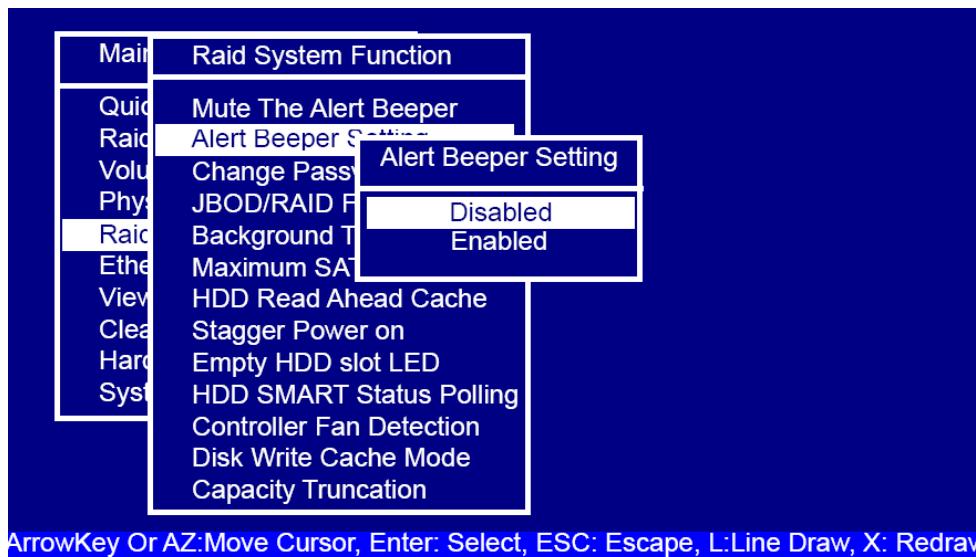

The beeper will still activate on the next event.

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

3.5.2 Alert Beeper Setting

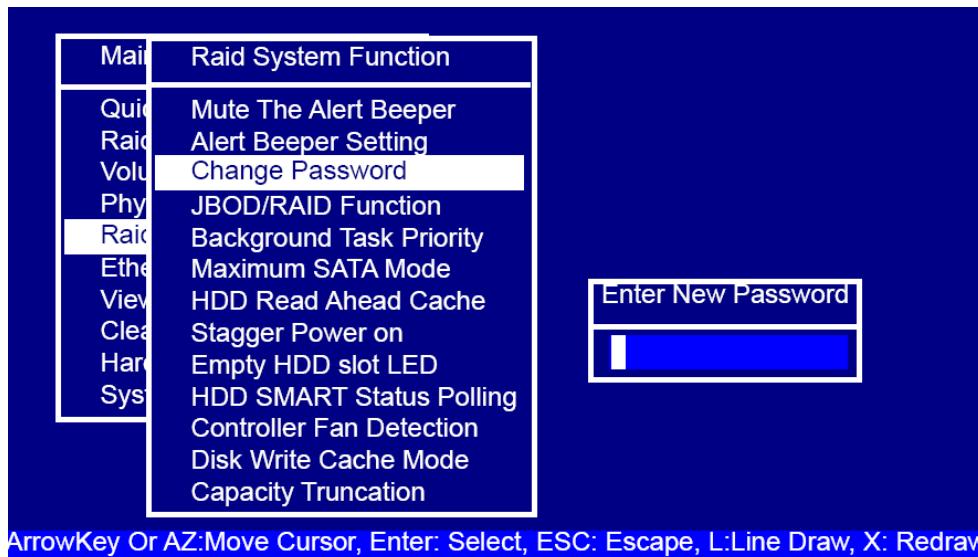

The Alert Beeper function is used to disable or enable the RAID Controller alarm tone generator. Select **Disabled** and press the **ENTER** key in the dialog box to turn the beeper off.

3.5.3 Change Password

The manufacturer default password is set to **ADMIN**. The password option allows the user to set or clear the password protection feature. Once the password has been set, the user can monitor and configure the controller only by providing the correct password. The Controller will check the password only when entering the main menu from the initial screen. The system will automatically go back to the initial screen if it does not receive any command in 20 seconds.

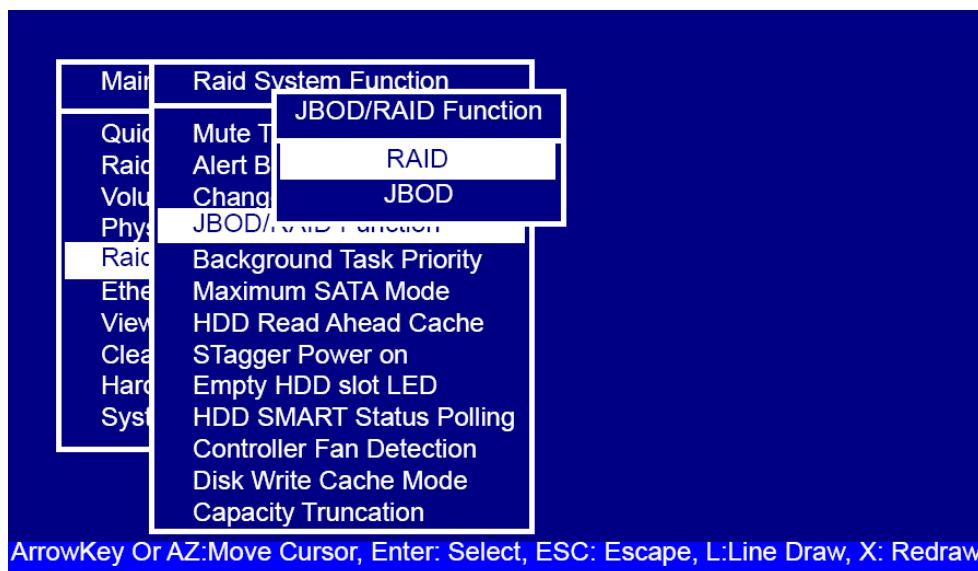

- To set or change the password, select **RAID System Function** and press **Change Password**. The Enter New Password screen will appear.
- To disable the password, only press the **ENTER** key in both the “Enter New Password” and “Re-Enter New Password” column. The existing password will be cleared. No password checking will occur when entering the main menu.

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

3.5.4 JBOD/RAID Function

JBOD is an acronym of *Just a Bunch Of Disks*. It represents a volume set that is created by the concatenation of partitions on the disk. The operating system can see all disks when the JBOD option is selected. It is necessary to delete any RAID set(s) on any disk(s) if switching from a RAID to a JBOD configuration.

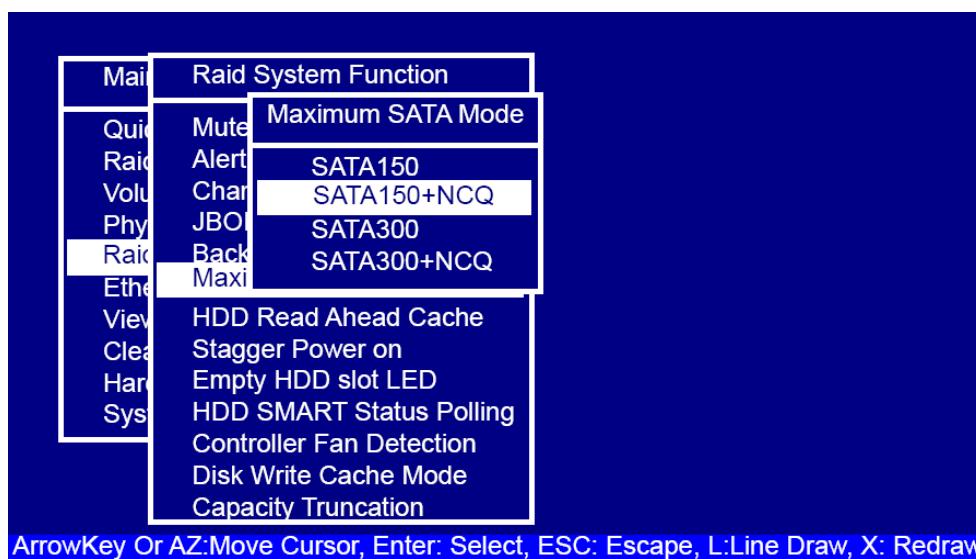

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

3.5.5 Background Task Priority

The “Background Task Priority” is a relative indication of how much time the controller devotes to a rebuild operation. The RAID Controller allows the user to choose the rebuild priority (ultralow, low, normal, high) to balance volume set access and rebuild tasks appropriately.

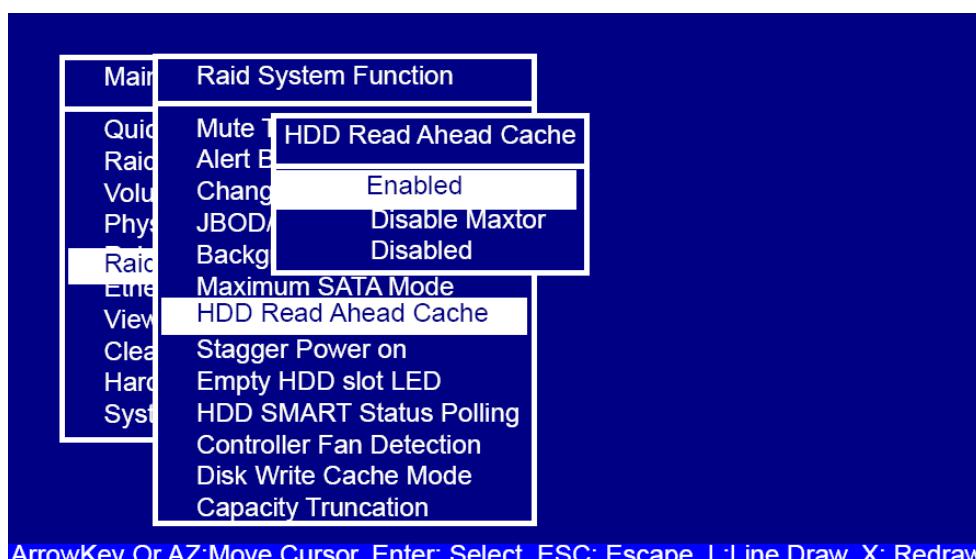

3.5.6 Maximum SATA Mode

The Controller can support up to SATA II, which runs up to 300MB/s, twice as fast as SATA150. NCQ is a command protocol in Serial ATA that can only be implemented on native Serial ATA hard drives. It allows multiple commands to be outstanding within a drive at the same time. Drives that support NCQ have an internal queue where outstanding commands can be dynamically rescheduled or re-ordered, along with the necessary tracking mechanisms for outstanding and completed portions of the workload.

3.5.7 HDD Read Ahead Cache

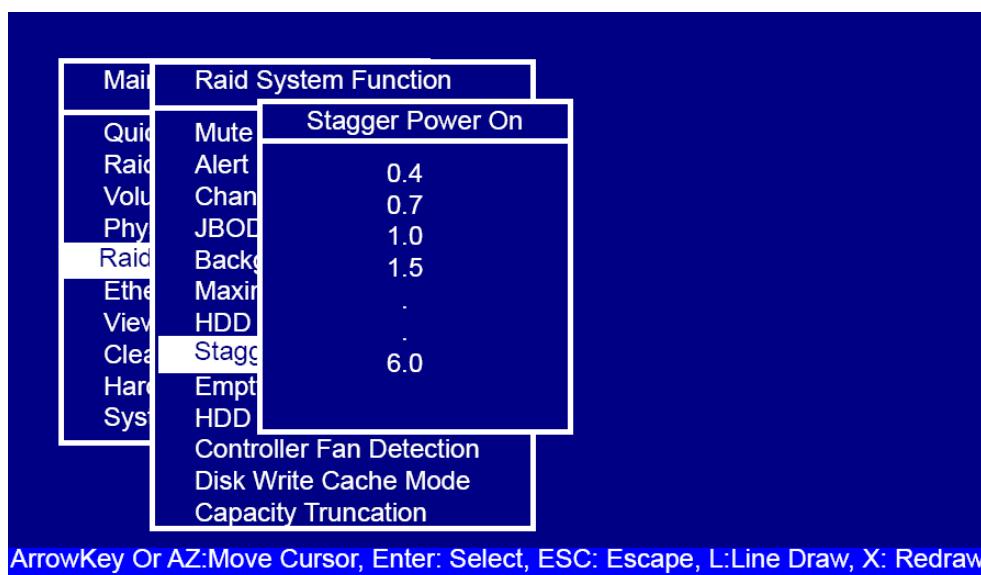

Allow Read Ahead—When Enabled, the drive's read ahead cache algorithm is used, providing maximum performance under most circumstances. This function is enabled by default.

3.5.8 Stagger Power On

In a PC system with only one or two drives, the power can supply enough power to spin up both drives simultaneously. But in systems with more than two drives, the startup current from spinning up the drives all at once can overload the power supply, causing damage to the power supply, disk drives and other system components. This damage can be avoided by allowing the host to stagger the spin-up of the drives. New SATA drives have support staggered spin-up capabilities to boost reliability.

The RAID Controller has included the option for the user to select the value for staggered power up. The value can be selected from 0.4ms to 6ms per step that powers up one drive.

3.5.9 Empty HDD slot HDD

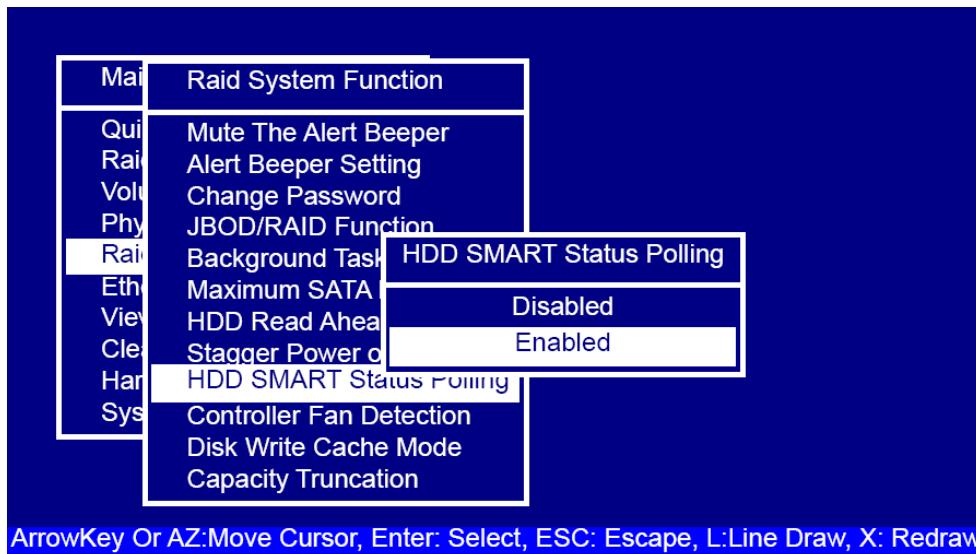

The Empty HDD Slot HDD option is to set up the Failed LED light ON or OFF. When each slot has a power LED for the HDD installed identify, the user can set this option to OFF. Choose this option ON, the failed LED light will flash red light if no HDD installed.

This feature is **not available** on the GV-DVR system.

3.5.10 HDD SMART Status Polling

An external RAID enclosure has the hardware monitor in the dedicated backplane that can report HDD temperature status to the controller. However, PCI cards do not use backplanes if the drives are internal to the main server chassis. The type of enclosure cannot report the HDD temperature to the controller.

For this reason, HDD SMART Status Polling was added to enable scanning of the HDD temperature function. It is necessary to enable the **HDD SMART Status Polling** function before SMART information is accessible. This function is disabled by default.

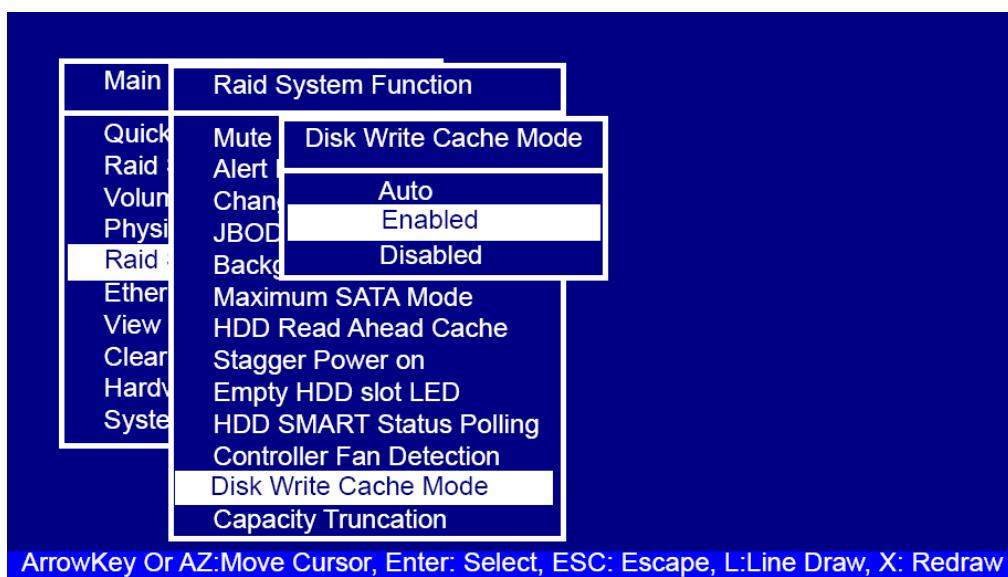

3.5.11 Controller Fan Detection

This function is **not available** on the GV-DVR system.

3.5.12 Disk Write Cache Mode

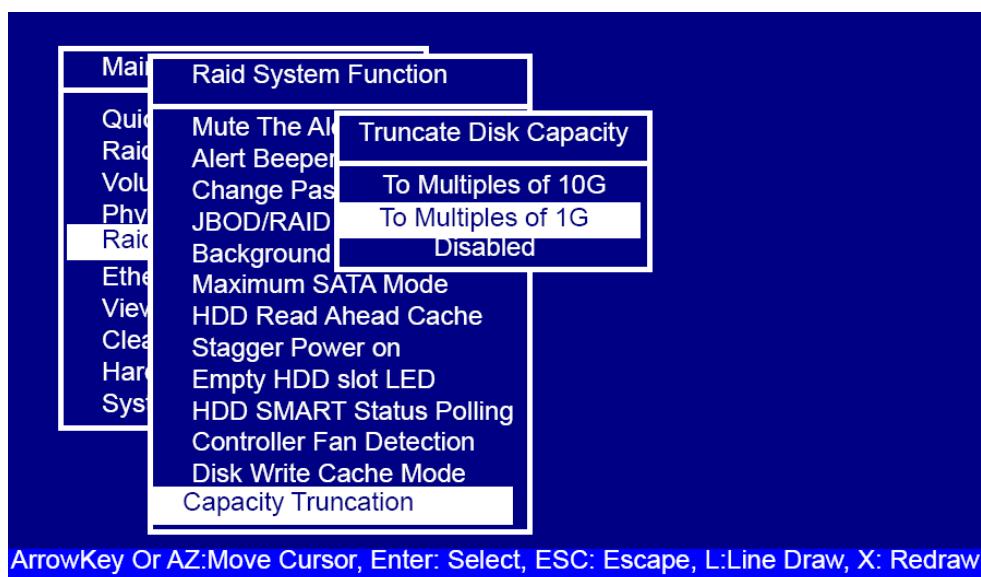

The user can set the “Disk Write Cache Mode” to Auto, Enabled, or Disabled. Enabled increases speed, and Disabled increases reliability.

3.5.13 Capacity Truncation

The RAID Controller uses drive truncation so that drives from different vendors are more likely to be usable as spares for one another. Drive truncation slightly decreases the usable capacity of a drive that is used in redundant units. The Controller provides three truncation modes in the system configuration: **Multiples Of 10G**, **Multiples Of 1G**, and **No Truncation**.

- **Multiples Of 10G:** If you have 120 GB drives from different vendors, chances are that the capacity varies slightly. For example, one drive might be 122.5 GB, and the other 120 GB. The drive truncation mode Multiples Of 10G uses the same capacity for both of these drives so that one could replace the other.
- **Multiples Of 1G:** If you have 123 GB drives from different vendors, chances are that the capacity varies slightly. For example, one drive might be 122.5 GB, and the other 122.4 GB. The drive truncation mode Multiples Of 1G uses the same capacity for both of these drives so that one could replace the other.
- **No Truncation:** It does not truncate the capacity. Within the subsystem, the SCSI chip acts as a target and 5 SATA II buses are connected to the drive.

3.6 View System Events

Choose this option to view the system events information: Timer, Device, Event type, Elapsed Time, and Errors. The RAID system does not have a real time clock. The Time information is the relative time from the RAID Controller powered on.

Main Menu			
Quick Volume/Raid Setup			
Time	Device	Event Type	ElapseTime Errors
2004-1-1 12:00:00	H/W Monitor	Raid Powered On	
2004-1-1 12:00:00	H/W Monitor	Raid Powered On	
2004-1-1 12:00:00	H/W Monitor	Raid Powered On	

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

3.7 Clear Events Buffer

Use this feature to clear the entire events buffer.

3.8 Hardware Monitor

Choose this option to view the RAID Controller's hardware monitor information. The Hardware Information screen appears. The Hardware Monitor Information provides the temperature and fan speed (I/O Processor fan) of the RAID Controller.

For this feature, you have to enable the **HDD SMART Status Polling** function first.

3.9 System Information

Choose this option to display Main processor, CPU Instruction cache and data cache size, firmware version, serial number, controller model name, and the cache memory size.

Main Menu

ArrowKey Or AZ:Move Cursor, Enter: Select, ESC: Escape, L:Line Draw, X: Redraw

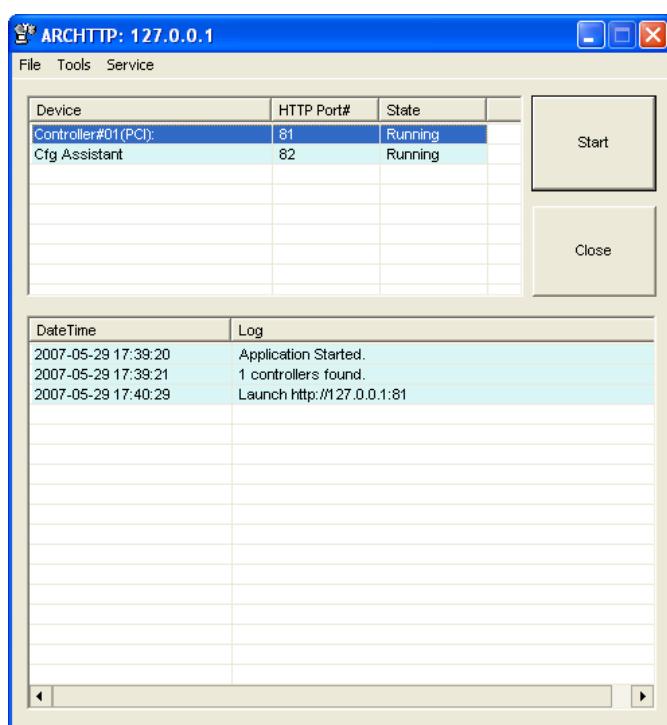

4. Web-Based Configuration

The ArcHTTP Proxy Server starts at system startup, allowing you to configure RAID arrays, Mail alerts and SNMP alerts via the browser.

Note: For the first time usage, do not configure hard drives by the web-based utility; otherwise the RAID configuration will fail. Use the BIOS-based configuration utility instead.

The Server provides you with two options:

- **Controller#01(PCI):** To enter the configuration page of RAID Controller, highlight the item, and then click **Start**. For more information, see *4.2 Web-Based RAID Configuration Utility*.
- **Cfg Assistant:** To enter the configuration page of ArcHTTP Proxy Server, highlight the item, and then click **Start**. For more information, see *4.1 ArcHTTP Proxy Server Configurations*.

Caution:

- The GV-desktop mode is designed without system tray, so please do not “minimize” the ArcHTTP dialog box. Otherwise you cannot call it up again.
- After you “close” the ArcHTTP dialog box, please click the **Programs** button on the GV-Desktop and then select **RAID Controller** to bring it up again.

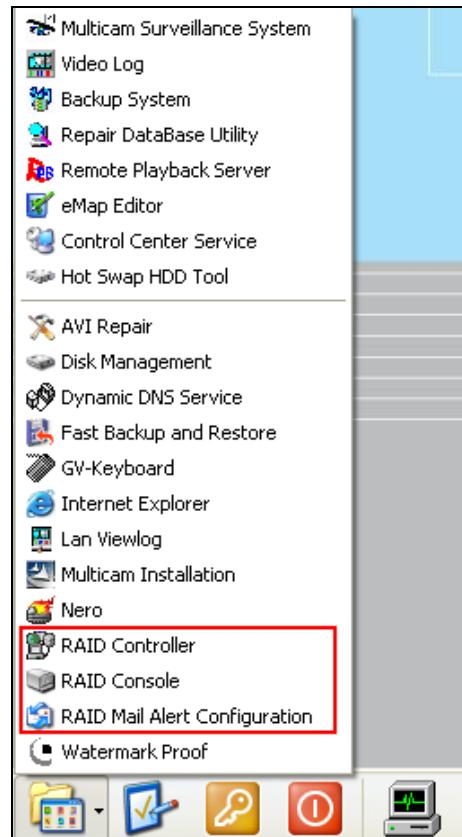

Access Options on GV-Desktop

To access configuration pages easily, direct links are also provided on the GV-Desktop.

On the GV-Desktop, click the **Programs** button and select the following options to the desired configuration page:

- **RAID Controller:** Brings up the ArcHTTP dialog box.
- **RAID Console:** Links to the web-based RAID configuration page. See *4.2 Web-Based RAID Configuration Utility*.
- **RAID Mail Alert Configuration:** Links to the Mail Configuration page. See *4.1.2 Mail Configuration*.

Note: If you have modified the default blind IP **127.0.0.1** of ArcHTTP Proxy Server, the links “RAID Console” and “RAID Mail Alert Configuration” will be invalid. For blind IP setting, see *4.1.1 General Configuration*.

4.1 ArcHTTP Proxy Server Configurations

To enter the configuration page of ArcHTTP Proxy Server, highlight **Cfg Assistant** on the ArcHTTP dialog box, and then click **Start**.

The ArcHTTP Proxy Server configurations include **General Configuration**, **Mail Configuration** and **SNMP Trap Configuration**.

4.1.1 General Configuration

On the General Configurations page, you can change the basic settings of the Server.

ARCHTTP Configurations

General Configuration	General Configurations
Mail Configuration	
SNMP Trap Configuration	

General Configuration

Binding IP	<input type="text" value="0.0.0"/>
HTTP Port#	<input type="text" value="81"/>
Display HTTP Connection Information To Console	<input type="radio"/> Yes <input checked="" type="radio"/> No
Scanning PCI Device	<input checked="" type="radio"/> Yes <input type="radio"/> No
Scanning RS-232 Device	<input type="radio"/> Yes <input checked="" type="radio"/> No
Scanning Inband Device	<input type="radio"/> Yes <input checked="" type="radio"/> No

Confirm The Operation

Submit **Reset**

- **Binding IP:** This item shows the current IP address of the Server. The default blinding IP is 127.0.0.1.
- **HTTP Port#:** You can change the default HTTP ports 81 and 82. By default the RAID Controller configuration page is set to 81, and the Server configuration page is 82. The port you assign here will be picked up by the RAID Controller configuration page; the Server will pick up the next number as HTTP port. (e.g. you enter port 1000 for the RAID configuration page; port 1001 will be picked up by the Server configuration page.)

Note: If your GV-DVR system is behind a firewall, make sure the default ports 81 and 82 are open; otherwise, you cannot configure the Server and RAID Controller.

- **Display HTTP Connection Information To Console:** The default setting is No.
- **Scanning PCI Device:** Not available.
- **Scanning RS-232:** Not available.
- **Scanning Inband Device:** Not available.

After the changes are made, select the **Confirm The Operation** check box and click **Submit**.

4.1.2 Mail Configuration

You can configure the mail server to send system notifications for the remote administrator.

Click **Mail Configuration** from the menu. This page appears.

ARCHTTP Configurations

- **SMTP Server Configurations:** Type the IP address of SMTP server.
- **Mail Address Configurations:** Type the sender name and sender e-mail address that will be shown in the outgoing e-mails. Type the account and password if the SMTP needs, and type the receiver's e-mail address and name.
- **Event Notification Configurations:** The controller classifies disk array events into four levels depending on their severity. These include level 1: Urgent, level 2: Serious, level 3: Warning and level 4: Information. The level 4 covers notification events such as initialization of the controller and initiation of the rebuilding process; Level 3 includes events which require the issuance of warning messages; Level 2 covers notification events which once have happen; Level 1 is the highest level, and covers events the need immediate attention (and action) from the administrator. The following charts list examples of different types of events.

Charts of Event Notification

A. Device Event

Event	Level	Meaning	Action
Device Inserted	Warning	HDD inserted	
Device Removed	Warning	HDD removed	
Reading Error	Warning	HDD reading error	Keep Watching HDD status, maybe it is caused by noise or HDD unstable.
Writing Error	Warning	HDD writing error	Keep Watching HDD status, maybe it is caused by noise or HDD unstable.
ATA Ecc Error	Warning	HDD ECC error	Keep Watching HDD status, maybe it is caused by noise or HDD unstable.
Change ATA Mode	Warning	HDD change ATA mode	Check HDD connection.
Time Out Error	Warning	HDD Time out	Keep Watching HDD status, maybe it is caused by noise or HDD unstable.
Device Failed	Urgent	HDD failure	Replace HDD
PCI Parity Error	Serious	PCI Parity error	If only happen once, it maybe caused by noise. If always happen, please check power supply or contact to us.
Device Failed (SMART)	Urgent	HDD SMART failure	Replace HDD
Pass Through Disk Created	Inform	Pass Through Disk Created	
Pass Through Disk Modified	Inform	Pass Through Disk Modified	
Pass Through Disk Deleted	Inform	Pass Through Disk Deleted	

B. Volume Event

Event	Level	Meaning	Action
Start Initialize	Warning	Volume initialization has started	
Start Rebuilding	Warning	Volume rebuilding has started	
Start Migrating	Warning	Volume migration has started	
Start Checking	Warning	Volume parity checking has started	
Complete Init	Warning	Volume initialization completed	
Complete Rebuild	Warning	Volume rebuilding completed	
Complete Migrate	Warning	Volume migration	

		completed	
Complete Check	Warning	Volume parity checking completed	
Create Volume	Warning	New Volume Created	
Delete Volume	Warning	Volume deleted	
Modify Volume	Warning	Volume Modified	
Volume Degraded	Urgent	Volume degraded	Replace HDD
Volume Failed	Urgent	Volume failure	
Failed Volume Revived	Urgent	Failed Volume revived	

C. RAID Set Event

Event	Level	Meaning	Action
Create RaidSet	Warning	New Raidset created	
Delete RaidSet	Warning	Raidset deleted	
Expand RaidSet	Warning	Raidset expanded	
Rebuild RaidSet	Warning	Raidset rebuilding	
RaidSet Degraded	Urgent	Raidset degraded	Replace HDD

D. Hardware Event

Event	Level	Meaning	Action
DRAM 1-Bit ECC	Urgent	DRAM 1-Bit ECC error.	Check DRAM
DRAM Fatal Error	Urgent	DRAM fatal error encountered.	Check the DRAM module and replace with new one if required.
Raid Powered On	Warning	Raid Power On	
Test Event	Urgent	Test Event	

4.1.3 SNMP Trap Configuration

You can configure SNMP to send system notification for the remote administrator. To configure the SNMP function, click **SNMP Trap Configuration**. This page appears.

ARCHHTTP Configurations

[Confirm The Operation](#)

[Submit](#) [Reset](#)

- **SNMP Trap Configurations:** Enter the SNMP Trap IP Address.
- **SNMP System Configurations:** Community name acts as a password to screen accesses to the SNMP agent of a particular network device. Type the community names of the SNMP agent. Before access is granted to a request station, this station must incorporate a valid community name into its request; otherwise, the SNMP agent will deny access to the system. Most network devices use “public” as default of their community names. This value is case-sensitive.
- **SNMP Trap Notification Configurations:** The SNMP Trap Notification Configurations include level 1: serious, level 2: error, level 3: Warning and level 4: Information. The level 4 covers notification events such as initialization of the controller and initiation of the rebuilding process; Level 3 includes events which require the issuance of warning messages; Level 2 covers notification events which once have happen; Level 1 is the highest level, and covers events the need immediate attention (and action) from the administrator. You can refer to “Charts of Event Notification” above for examples of events.

4.2 Web-Based RAID Configuration Utility

To enter the configuration page of RAID Controller, highlight **Controller#01(PCI)** on the ArchHTTP dialog box, and then click **Start**.

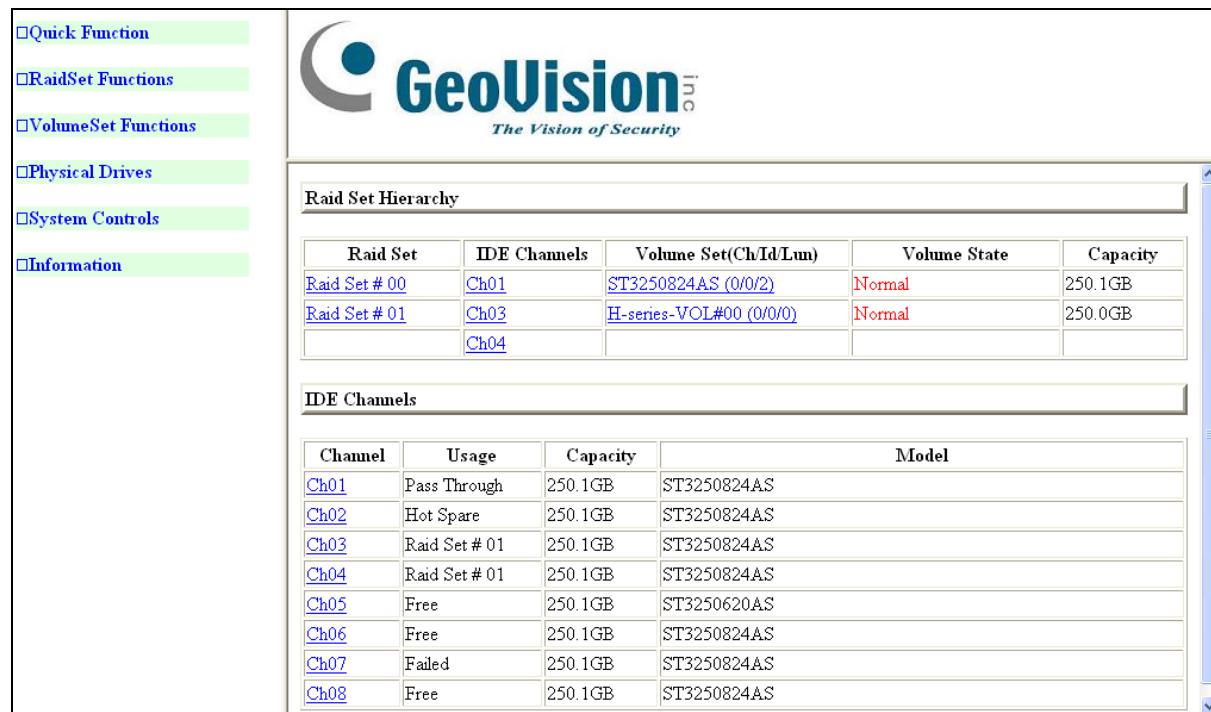

It will pop up a dialog box for authentication.

User name: **admin**

Password: **admin**

The web-based RAID Configuration utility displays the current configuration of your RAID Controller. It displays the **RAID Set List**, **Volume Set List**, and **Physical Disk List**. The current configuration can also be viewed by clicking on **RaidSet Hierarchy** in the menu. See [5.6.1 RaidSet Hierarchy](#).

- **RAID Set Hierarchy**

The screenshot shows the GeoVision web-based RAID configuration interface. On the left, a vertical menu bar lists several options: Quick Function, RaidSet Functions, VolumeSet Functions, Physical Drives, System Controls, and Information. The 'Information' option is currently selected, highlighted in blue. The main content area is divided into two tables. The top table, titled 'Raid Set Hierarchy', displays two RAID sets: 'Raid Set # 00' and 'Raid Set # 01'. The 'Raid Set # 00' row contains three entries: 'Ch01' (IDE Channel), 'ST3250824AS (0/0/2)' (Volume Set), 'Normal' (Volume State), and '250.1GB' (Capacity). The 'Raid Set # 01' row contains three entries: 'Ch03' (IDE Channel), 'H-series-VOL#00 (0/0/0)' (Volume Set), 'Normal' (Volume State), and '250.0GB' (Capacity). The bottom table, titled 'IDE Channels', lists eight channels: Ch01, Ch02, Ch03, Ch04, Ch05, Ch06, Ch07, and Ch08. Each channel entry includes its name, usage (e.g., Pass Through, Hot Spare, Raid Set # 01, Free, Failed), capacity (250.1GB or 250.0GB), and model (ST3250824AS or ST3250620AS).

Raid Set	IDE Channels	Volume Set(Ch/Id/Lun)	Volume State	Capacity
Raid Set # 00	Ch01	ST3250824AS (0/0/2)	Normal	250.1GB

5. Main Menu of Web-based Configuration

The Main Menu shows all available functions.

Individual Category	Description
Quick Function	Create a default configuration, which is based on the number of physical disks installed; it can modify the volume set capacity, RAID level, and stripe size.
RAID Set Functions	Create a customized RAID set.
Volume Set Functions	Create customized volume sets and modify the existed volume sets parameter.
Physical Drives	Create pass through disks and modify the existing pass through drives parameters. Also provides the function to identify disk drives (blinking LED).
System Controls	Set the RAID system configuration.
Information	View the controller information. The RAID set hierarchy can be viewed with the RaidSet Hierarchy option.

Note: The login user name and password by default is **admin**.

5.1 Quick Function

The number of physical drives in the RAID Controller determines the RAID levels that can be implemented with the RAID set. You can create a RAID set associated with exactly one volume set. Click **Quick Function** and select **Quick Create**. This page appears.

You can change the RAID level, stripe size, and capacity. A hot spare option is also created depending on the existing configuration. Select the **Confirm The Operation** check box and click **Submit**. The RAID set and volume set will start to initialize.

Note:

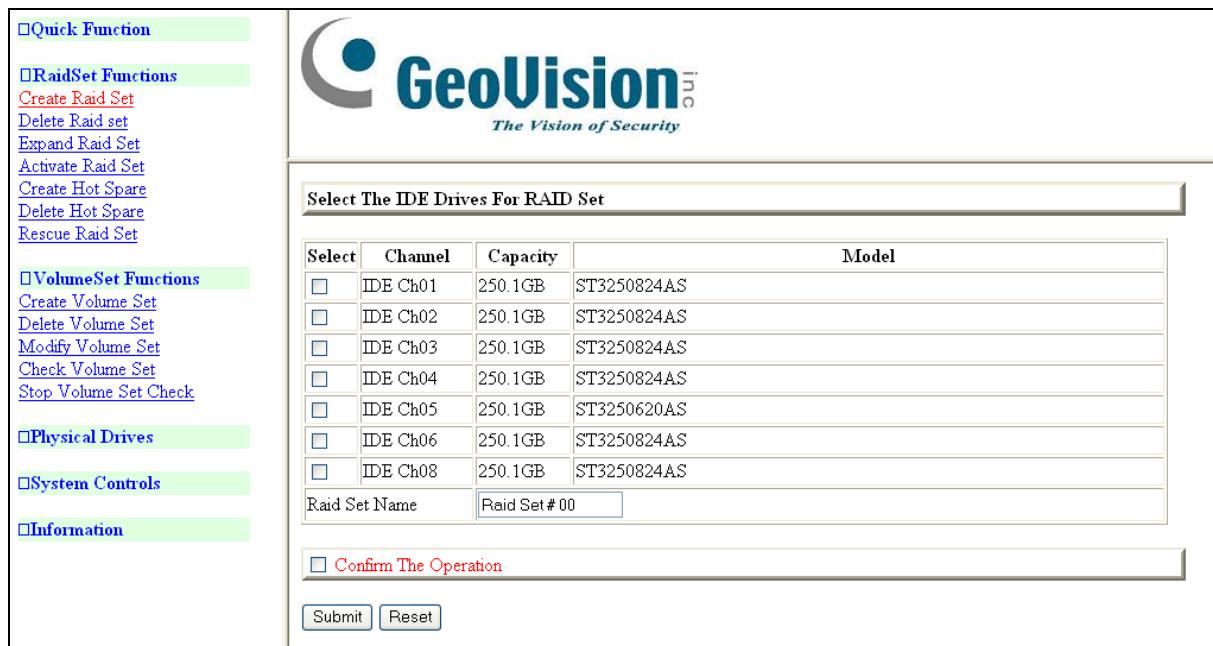

1. In Quick Create, your volume set is automatically configured based on the number of disks in your system. Use the **Raid Set Function** and **Volume Set Function** if you prefer to customize your system.
2. If volume capacity exceeds 2TB, the utility will show the “Greater 2 TB volume Support” item. Select **For Windows** from the drop-down list. DO NOT select **Use 64 bit LBA** that will not work on the GV-DVR system.

5.2 RAID Set Functions

Use the RAID Set Function and Volume Set Function if you prefer to customize your system. Manual configuration can provide full control of the RAID set settings, but it will take longer time to complete than the Quick Volume / RAID Setup configuration. Select **RAID Set Functions** to manually configure the raid set for the first time or delete and reconfigure existing raid sets. (A RAID set is a group of disks containing one or more volume sets.)

5.2.1 Create RAID Set

To create a RAID set, select **Create RAID Set**. This page appears.

Select	Channel	Capacity	Model
<input type="checkbox"/>	IDE Ch01	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch02	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch03	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch04	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch05	250.1GB	ST3250620AS
<input type="checkbox"/>	IDE Ch06	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch08	250.1GB	ST3250824AS
Raid Set Name		Raid Set #00	
<input type="checkbox"/> Confirm The Operation			
<input type="button" value="Submit"/> <input type="button" value="Reset"/>			

It shows the drive(s) connected to the current controller. Select the physical drives within the current RAID set. Enter 1 to 15 alphanumeric characters to define a unique identifier for a RAID set. The default RAID set name will always appear as “Raid Set. #”. Select the **Confirm The Operation** check box and click **Submit**. The RAID set will start to initialize.

5.2.2 Delete RAID Set

To delete a RAID set, select **Delete RAID Set**. This page appears.

Select	Raid Set Name	Member Disks	Capacity
<input checked="" type="radio"/>	Raid Set # 00	1	250.0GB

Confirm The Operation, VolumeSet In This RaidSet Will Also Be Deleted

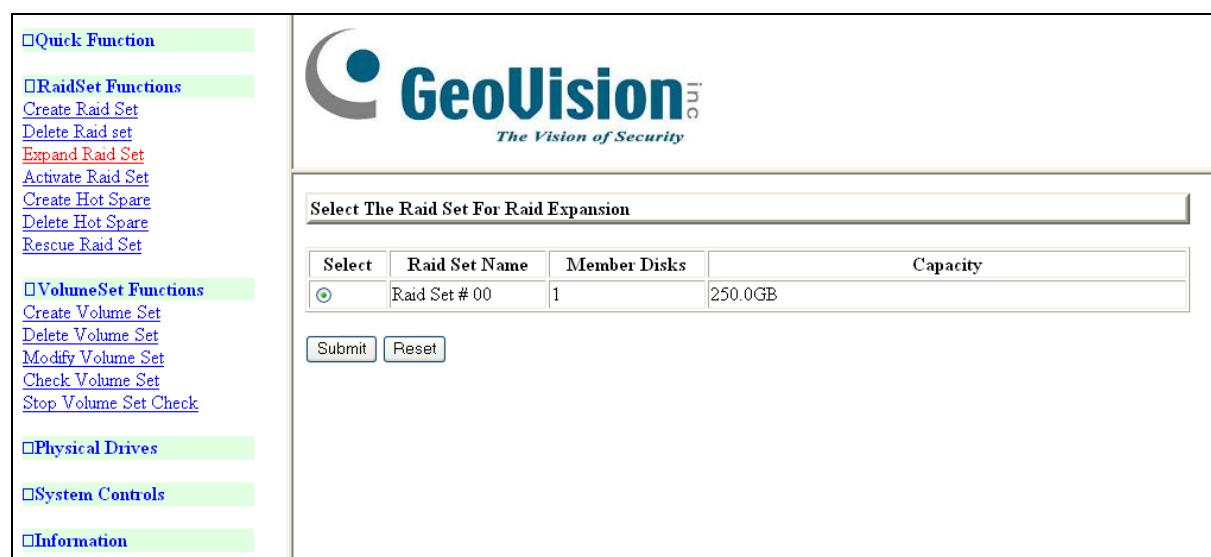

Submit **Reset**

It shows all existing RAID sets in the current controller. Select the RAID set number you want to delete and select the **Confirm The Operation** check box, and then click **Submit** to delete it.

5.2.3 Expand RAID Set

When a disk is added to your system, you can expand a RAID set. This function becomes active when at least one drive is available.

To expand a RAID set, select **Expand Raid Set**. This page appears.

Select	Raid Set Name	Member Disks	Capacity
<input checked="" type="radio"/>	Raid Set # 00	1	250.0GB

Submit **Reset**

Select the RAID set to be expanded. Select the disk and the **Confirm The Operation** check box, and then click **Submit**.

5.2.4 Activate Incomplete RAID Set

If one of the disk drives is removed when power is off, the RAID set state will change to “Incomplete State.” If you want to continue to power-on the SATA RAID controller, you can use the **Activate RAID Set** option to active the RAID set. After you complete this procedure, the Raid State will change to “*Degraded Mode*”.

To activate the incomplete RAID, select **Activate Raid Set**. This page appears.

Select	Raid Set Name	Member Disks	Capacity
<input checked="" type="radio"/>	Raid Set # 00	1	250.0GB

It shows the RAID sets existing on the current controller. Select the RAID set to activate in the select column. Click **Submit** to activate the RAID set that had a disk removed (or failed) in the power off state. The SATA RAID controller will continue to work in degraded mode.

5.2.5 Create Hot Spare

The Create Hot Spare option allows you to define a global hot spare. All unused physical devices connected to the current controller display on the “Select The IDE Drives For Hot Spare” page.

Select The IDE Drives For Hot Spare

Select	Channel	Capacity	Model
<input type="checkbox"/>	IDE Ch02	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch03	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch04	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch05	250.1GB	ST3250620AS
<input type="checkbox"/>	IDE Ch06	250.1GB	ST3250824AS
<input type="checkbox"/>	IDE Ch08	250.1GB	ST3250824AS

Confirm The Operation

Submit **Reset**

Select the disks, select the **Confirm The Operation** check box, and click **Submit** to create the hot spares.

5.2.6 Delete Hot Spare

To delete a hot spare drive, select **Delete Hot Spare**. This page appears.

Select The Hot Spare Drive To Delete

Select	Channel	Capacity	Model
<input type="checkbox"/>	IDE Ch02	250.1GB	ST3250824AS

Confirm The Operation

Submit **Reset**

Select the Hot Spare disk, select the **Confirm The Operation** check box and then click **Submit** to delete the hot spare.

5.2.7 Rescue RAID Set

When the system is powered off in the RAID set update / creation period, the RAID configurations possibly could disappear due to this abnormal condition.

□ Quick Function

□ RaidSet Functions

Create Raid Set

Delete Raid set

Expand Raid Set

Activate Raid Set

Create Hot Spare

Delete Hot Spare

Rescue Raid Set

□ VolumeSet Functions

Create Volume Set

Delete Volume Set

Modify Volume Set

□ Physical Drives

□ System Controls

□ Information

Try To Rescue Missing RAIDSET
 Enter 'RESCUE' To Try To Recover Missing RaidSet
 Enter 'SIGNAT' To Regenerate RaidSet Signature If RaidSet Is Recovered

Enter The Keyword

Confirm The Operation

The “**RESCUE**” function can recover the missing RAID set information. The RAID Controller uses the time as the RAID set signature. The RAID set may have different time after the RAID set is recovered. The “**SIGANT**” function can regenerate the signature for the RAID set.

5.3 Volume Set Functions

A volume set is seen by the host system as a single logical device. It is organized in a RAID level with one or more physical disks. RAID level refers to the level of data performance and protection of a volume set. A volume set capacity can consume all or a portion of the disk capacity available in a RAID set. Multiple volume sets can exist on a group of disks in a RAID set. Additional volume sets created in a specified RAID set will reside on all the physical disks in the RAID set. Thus each volume set on the RAID set will have its data spread evenly across all the disks in the RAID set.

5.3.1 Create Volume Set

1. Volume sets of different RAID levels may coexist on the same RAID set.
2. Up to 16 volume sets can be created by the RAID Controller.
3. The maximum addressable size of a single volume set is not limited to 2 TB because the controller is capable of 64-bit mode.

To create a volume set on a RAID set, click **Create Volume Set**. The “Select The Raid Set To Create Volume On It” page shows all RAID set numbers. Select the RAID set number that is to be used and then click **Submit**.

<input type="checkbox"/> Quick Function <input type="checkbox"/> RaidSet Functions <input type="checkbox"/> VolumeSet Functions Create Volume Set Delete Volume Set Modify Volume Set Check Volume Set Stop Volume Set Check <input type="checkbox"/> Physical Drives <input type="checkbox"/> System Controls <input type="checkbox"/> Information	 <p>Select The Raid Set To Create Volume On It</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">Select</th> <th style="width: 20%;">Raid Set Name</th> <th style="width: 20%;">Member Disks</th> <th style="width: 50%;">Capacity</th> </tr> </thead> <tbody> <tr> <td><input checked="" type="radio"/></td> <td>Raid Set # 00</td> <td>1</td> <td>250.0GB</td> </tr> </tbody> </table> <p style="text-align: center;">Submit Reset</p>	Select	Raid Set Name	Member Disks	Capacity	<input checked="" type="radio"/>	Raid Set # 00	1	250.0GB
Select	Raid Set Name	Member Disks	Capacity						
<input checked="" type="radio"/>	Raid Set # 00	1	250.0GB						

This option allows you to select the volume name, capacity, RAID level, stripe size, SCSI ID/LUN, cache mode, and tag queuing.

<input type="checkbox"/> Quick Function <input type="checkbox"/> RaidSet Functions <input type="checkbox"/> VolumeSet Functions Create Volume Set Delete Volume Set Modify Volume Set Check Volume Set Stop Volume Set Check <input type="checkbox"/> Physical Drives <input type="checkbox"/> System Controls <input type="checkbox"/> Information	 <p>Enter Volume Attribute On Raid Set # 00</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tbody> <tr> <td style="width: 45%;">Volume Name</td> <td style="width: 55%;">H-series-VOL#01</td> </tr> <tr> <td>Member Disks</td> <td>8</td> </tr> <tr> <td>Volume Raid Level</td> <td>Raid 5</td> </tr> <tr> <td>Max Capacity Allowed</td> <td>2230 GB</td> </tr> <tr> <td>Select Volume Capacity</td> <td>2230 GB</td> </tr> <tr> <td>Greater Two TB Volume Support</td> <td>For Windows</td> </tr> <tr> <td>Volume Initialization Mode</td> <td>Foreground Initialization</td> </tr> <tr> <td>Volume Stripe Size</td> <td>64 KBytes</td> </tr> <tr> <td>Volume Cache Mode</td> <td>Write Back</td> </tr> <tr> <td>Tagged Command Queuing</td> <td>Enabled</td> </tr> <tr> <td>SCSI Channel:SCSI ID:SCSI Lun</td> <td>0 : 0 : 1</td> </tr> </tbody> </table> <p style="text-align: center;"><input checked="" type="checkbox"/> Confirm The Operation</p> <p style="text-align: center;">Submit Reset</p>	Volume Name	H-series-VOL#01	Member Disks	8	Volume Raid Level	Raid 5	Max Capacity Allowed	2230 GB	Select Volume Capacity	2230 GB	Greater Two TB Volume Support	For Windows	Volume Initialization Mode	Foreground Initialization	Volume Stripe Size	64 KBytes	Volume Cache Mode	Write Back	Tagged Command Queuing	Enabled	SCSI Channel:SCSI ID:SCSI Lun	0 : 0 : 1
Volume Name	H-series-VOL#01																						
Member Disks	8																						
Volume Raid Level	Raid 5																						
Max Capacity Allowed	2230 GB																						
Select Volume Capacity	2230 GB																						
Greater Two TB Volume Support	For Windows																						
Volume Initialization Mode	Foreground Initialization																						
Volume Stripe Size	64 KBytes																						
Volume Cache Mode	Write Back																						
Tagged Command Queuing	Enabled																						
SCSI Channel:SCSI ID:SCSI Lun	0 : 0 : 1																						

- **Volume Name**

The default volume name will always appear as “Volume Set. #”. You can rename the volume set providing it does not exceed the 15 characters limit.

- **RAID Level**

Set the RAID level for the Volume Set. Highlight the desired Raid Level and press the **ENTER** key.

The available RAID levels for the current Volume Set are displayed. Select a RAID level and press the **ENTER** key to confirm.

- **Capacity**

The maximum volume size is the default initial setting. Enter the appropriate volume size to fit your application.

- **Greater Two TB Support**

If volume capacity exceeds 2TB, this item appears. Select **For Windows** from the drop-down list. Do not select **Use 64bit LBA** since this selection does not work on the GV-DVR system.

- **Initialization Mode**

Press the **Enter** key to define fast initialization or select the Background (Instant Available). When Background Initialization begins, the initialization proceeds as a background task, the volume set is fully accessible for system reads and writes. The operating system can instantly access to the newly created arrays without requiring a reboot and waiting the initialization complete. When Fast Initialization begins, the initialization proceeds must be completed before the volume set ready for system accesses.

- **Stripe Size**

This parameter sets the size of the stripe written to each disk in a RAID 0, 1, RAID 1E, 5 or 6 logical drives. You can set the stripe size to 4 KB, 8 KB, 16 KB, 32 KB, 64 KB, or 128 KB. A larger stripe size produces better read performance, especially if your computer does mostly sequential reads. However, if your computer does random reads more often, select a smaller stripe size.

Note: RAID level 3 can't modify stripe size.

- **Cache Mode**

The SATA RAID controller supports Write-Through Cache and Write-Back Cache.

- **Tag Queuing**

Enabling this option is useful for enhancing overall system performance in multi-task operating systems. The Command Tag (Drive Channel) function controls the SCSI command tag queuing support for each drive channel. This function should normally remain enabled. Disable this function only when using older SCSI drives that do not support command tag queuing

- **SCSI Channel/SCSI ID/SCSI Lun**

■ **SCSI Channel:** The SATA RAID controller function is simulated as a SCSI RAID controller. The host bus is represented as a SCSI channel. Select the SCSI Channel.

- **SCSI ID:** Each SCSI device attached to the SCSI card, as well as the card itself, must be assigned a unique SCSI ID number. A SCSI channel can connect up to 15 devices. The SATA RAID Controller is a large SCSI device. Assign an ID from a list of SCSI IDs.
- **SCSI LUN:** Each SCSI ID can support up to 8 LUNs. Most SCSI controllers treat each LUN like a SCSI disk.

5.3.2 Delete Volume Set

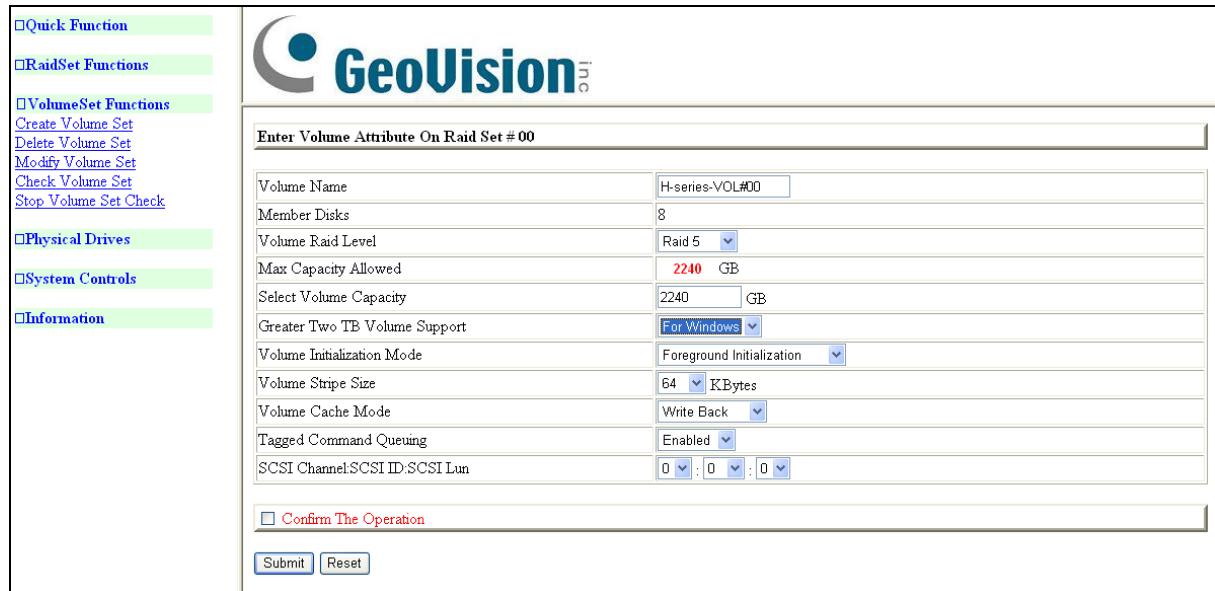

To delete a Volume from RAID set, select **Delete Volume Set**. This page appears.

The “Select The Volume Set To Delete” page shows all RAID set numbers. Select a RAID set number and the **Confirm The Operation** check box, and then click **Submit** to show all volume set items in the selected RAID set. Select a volume set number, select the **Confirm The Operation** check box, and then click **Submit** to delete the volume set.

5.3.3 Modify Volume Set

Use this option to modify the volume set configuration. To modify volume set attributes, click **Volume Set Functions** and then select **Modify Volume Set**. The “Select The Volume Set For Modification” page appears.

Select the volume set check box from the list that you wish to modify, and then click **Submit**. This page appears.

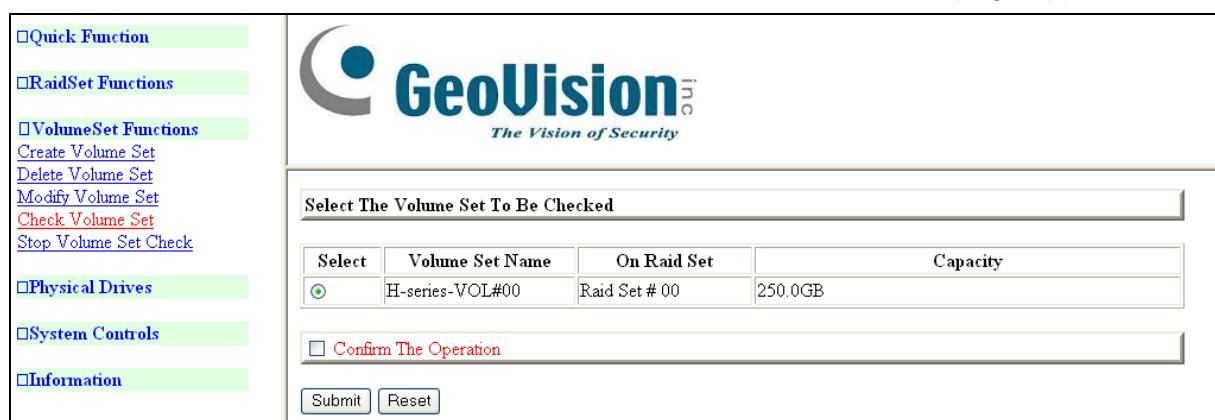

All values can be modified except Max Capacity Allowed. After you complete the modification, select the **Confirm The Operation** check box and click **Submit**.

5.3.4 Check Volume Set

Use this option to verify the correctness of the redundant data in a volume set. For example, in a system with dedicated parity, volume set check means computing the parity of the data disk drives and comparing the results to the contents of the dedicated parity disk drive. The RaidSet Hierarchy option in the menu of Information also displays the information about checking percentage.

To check a volume set from a RAID set, select **Check Volume Set**. This page appears.

Select the volume set from the list that you wish to check, select the **Confirm The Operation** check box, and then click **Submit**.

5.3.5 Stop Volume Set Check

To stop checking volume consistency, select **Stop Volume Set Check**, select the **Confirm The Operation** check box, and then click **Submit**.

Select the IDE drive For Pass Through

Select	Channel	Capacity	Model
<input checked="" type="radio"/>	IDE Ch01	250.1GB	ST3250824AS
<input type="radio"/>	IDE Ch02	250.1GB	ST3250824AS
<input type="radio"/>	IDE Ch03	250.1GB	ST3250824AS
<input type="radio"/>	IDE Ch04	250.1GB	ST3250824AS
<input type="radio"/>	IDE Ch05	250.1GB	ST3250620AS
<input type="radio"/>	IDE Ch06	250.1GB	ST3250824AS
<input type="radio"/>	IDE Ch08	250.1GB	ST3250824AS

Enter Pass Through Disk Attribute

Volume Cache Mode	Write Back
Tagged Command Queuing	Enabled
SCSI Channel:SCSI_ID:SCSI_Lun	0:0:0

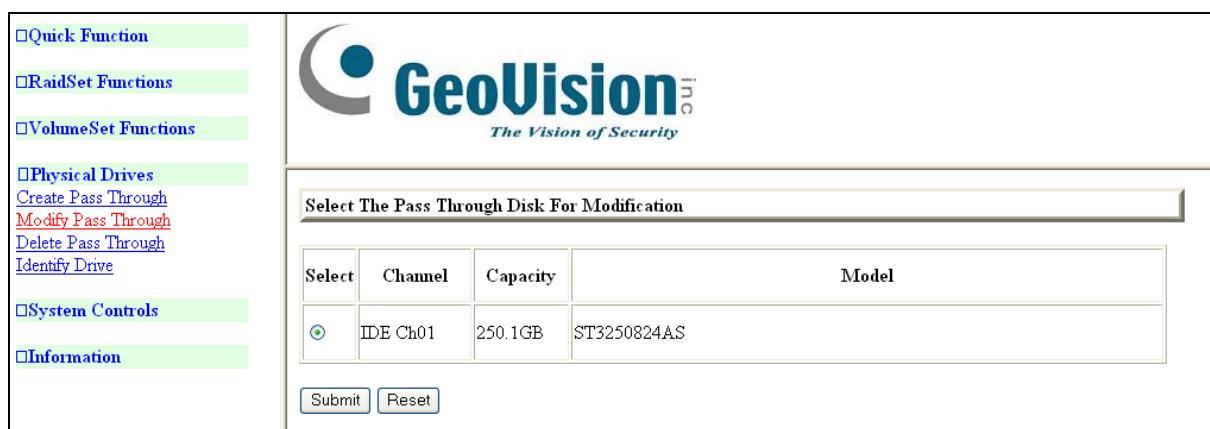

Confirm The Operation

Submit Reset

A pass-through disk is not controlled by the SATA RAID controller firmware; it cannot be a part of a volume set. The disk is available to the operating system as an individual disk. It is typically used on a system where the operating system is on a disk not controlled by the RAID firmware. You can also select the **Volume Cache Mode** (Write Back / Write Through), enable or disable **Tagged Command Queuing**, and set **SCSI channel/SCSI_ID/SCSI_LUN** for this volume.

5.4.2 Modify Pass Through Disk

This function is used to modify the Pass-Through Disk attribute. You can modify the cache mode, Tagged Command Queuing, and SCSI channel/ID/LUN on an existing pass through disk. To modify the pass-through drive attribute from the pass-through drive pool, select **Modify Pass Through**. The “Select The Pass Through Disk For Modification” page appears.

Select	Channel	Capacity	Model
<input checked="" type="radio"/>	IDE Ch01	250.1GB	ST3250824AS

Select Pass-Through disk from the pass-through drive pool and click **Submit**. When the “Enter Pass-Through Disk Attribute” page appears, modify the drive attribute values.

Volume Cache Mode	Write Back
Tagged Command Queuing	Enabled
SCSI Channel:SCSI_ID:SCSI_Lun	0 : 0 : 2

After you finish the selection, select the **Confirm The Operation** check box and click **Submit** to complete the modification.

5.4.3 Delete Pass Through Disk

To delete a pass-through drive from the pass-through drive pool, select **Delete Pass Through**.

Select	Channel	Capacity	Model
<input checked="" type="radio"/>	IDE Ch01	250.1GB	ST3250824AS

After you complete the selection, select the **Confirm The Operation** check box and click **Submit** to delete the disk.

5.4.4 Identify Selected Drive

To prevent removal of the wrong drive, the selected disk LED will light so as to physically locate the intended disk when **Identify Selected Drive** is selected.

This feature is **not available** on the GV-DVR system.

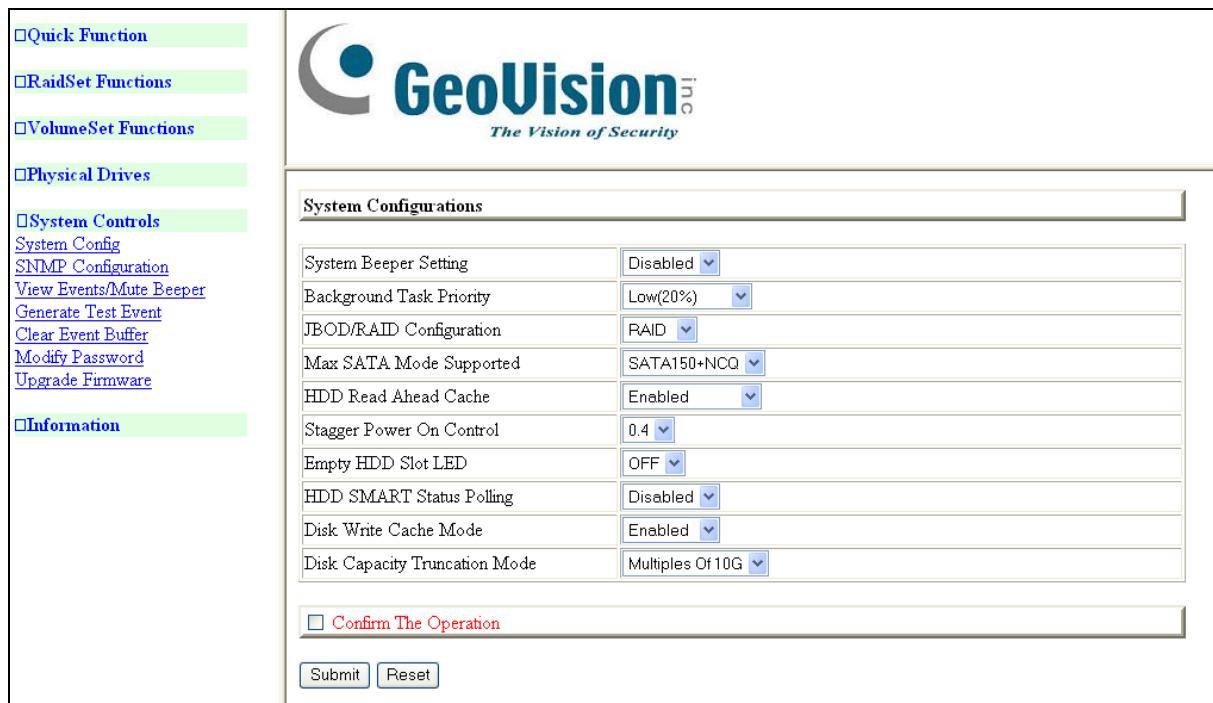

Select	Channel	Capacity	Model
<input checked="" type="radio"/>	IDE Ch01	250.1GB	ST3250824AS
<input type="radio"/>	IDE Ch02	250.1GB	ST3250824AS

5.5 System Controls

5.5.1 System Config

To set the RAID system function, click **System Controls** and then select **System Config**.

The "System Configurations" page appears.

System Configurations	
System Beeper Setting	Disabled
Background Task Priority	Low(20%)
JBOD/RAID Configuration	RAID
Max SATA Mode Supported	SATA150+NCQ
HDD Read Ahead Cache	Enabled
Stagger Power On Control	0.4
Empty HDD Slot LED	OFF
HDD SMART Status Polling	Disabled
Disk Write Cache Mode	Enabled
Disk Capacity Truncation Mode	Multiples Of 10G

Confirm The Operation

Submit Reset

- **System Beeper Setting**

Use the drop-down list to select Enabled or Disabled to control the SATA RAID controller alarm tone generator.

- **Background Task Priority**

The Raid Rebuild Priority indicates how much time the controller devotes to a rebuild operation. The SATA RAID controller allows you to choose the rebuild priority to balance volume set access and rebuild tasks appropriately. The priority options include **ultraLow (5%)**, **Low (20%)**, **Normal (50%)** and **High (80%)**. For high array performance, select **Low (20%)**.

- **JBOD/RAID Configuration**

JBOD is an acronym for "Just a Bunch Of Disks". It represents a volume set that is created by the concatenation of partitions on the disk. The OS can see all disks when this option is selected. It is necessary to delete a RAID set if the disks in that set are to be converted to JBOD mode.

- **Max SATA Mode Supported**

The Controller can support up to SATA II, which runs up to 300MB/s. NCQ is a command protocol in Serial ATA that can only be implemented on native Serial ATA hard drives. It allows multiple commands to be outstanding within a drive at the same time. Drives that support NCQ have an internal queue where outstanding commands can be dynamically rescheduled or re-ordered, along with the necessary tracking mechanisms for outstanding and completed portions of the workload. The RAID system allows you to choose the following SATA Mode (listed from slowest to fastest): **SATA150**, **SATA150+NCQ**, **SATA300**, **SATA300+NCQ**.

- **HDD Read Ahead Cache**

When Read Ahead is enabled (set **Enabled** at default), the drive's read ahead cache algorithm is used, providing maximum performance under most circumstances.

- **Stagger Power On Control**

In a PC with only one or two drives, the power supply can provide enough power to spin up both drives simultaneously. But in systems with more than two drives, the startup current from spinning up the drives all at once can overload the power supply, causing damage to the power supply, disk drives and other system components. However, allowing the host to stagger the spin-up of the drives can avoid the damage.

New SATA drives support staggered spin-up capabilities to boost reliability. Staggered spin-up is a very useful feature for managing multiple disk drives in a storage subsystem. It gives the host the ability to spin up the disk drives sequentially or in groups, allowing the drives to come ready at the optimum time without straining the system power supply. Staggering drive spin-up in a multiple drive environment also avoids the extra cost of a power supply designed to meet short-term startup power demand as well as steady state conditions.

The RAID Controller has included the option for customer to select the disk drives sequentially stagger power up value. The values can be selected from 0.4ms to 6ms per step which powers up one drive.

- **Empty HDD Slot LED (Not Available)**

When each slot has a power LED for the HDD installed to identify, you can set this option to **OFF**. Select **ON**, the failed LED light will flash red light; if no HDD installed.

- **HDD SMART Status Polling**

An external RAID enclosure has the hardware monitor in the dedicated backplane that can report HDD temperature status to the controller. However, PCI cards do not use

backplanes if the drives are internal to the main server chassis. The type of enclosure cannot report the HDD temperature to the controller.

For this reason, HDD SMART Status Polling is designed to enable scanning of the HDD temperature function. It is necessary to enable the **HDD SMART Status Polling** function before SMART information is accessible. This function is disabled by default.

- **Disk Write Cache Mode**

Use the drop-down list to select **Auto**, **Enabled**, or **Disabled** to set the mode.

- **Disk Capacity Truncation Mode**

The RAID controller uses drive truncation so that drives from differing vendors are more likely to be able to be used as spares for each other. Drive truncation slightly decreases the usable capacity of a drive that is used in redundant units.

The controller provides three truncation modes in the system configuration: **Multiples Of 10G**, **Multiples Of 1G**, and **No Truncation**.

- **Multiples Of 10G:** If you have 120 GB drives from different vendors; chances are that the capacity varies slightly. For example, one drive might be 122.5 GB, and the other 120 GB. The drive at Truncation mode **Multiples Of 10G** uses the same capacity for both of these drives so that one could replace the other.
- **Multiples Of 1G:** If you have 123 GB drives from different vendors; chances are that the capacity varies slightly. For example, one drive might be 122.5 GB, and the other 122.4 GB. The drive at Truncation mode **Multiples Of 1G** uses the same capacity for both of these drives so that one could replace the other.
- **No Truncation:** It does not truncate the capacity.

5.5.2 SNMP Configuration

Select SNMP Configuration, this page appears.

Note: The SNMP configuration will not work on this page. For configurations, please see [4.1.3 SNMP Trap Configuration](#).

It displays the system events information: **Time**, **Device**, **Event Type**, **Elapse Time** and **Errors**.

The RAID system does not have a built-in real time clock. The information about Time displayed here is synchronized with the time of the system.

5.5.4 Generate Test Event

To generate events for testing purposes, select **Generate Test Event**, select the **Confirm The Operation** check box, and then click **Submit**.

5.5.6 Modify Password

This option allows you to set or clear the RAID Controller's password protection feature. Once the password is set, you can only monitor and configure the RAID Controller with the correct password. To set or change the RAID Controller password, click **Modify Password**. The "Modify System Password" page appears.

Modify System Password

Enter Original Password:

Enter New Password:

Re-Enter New Password:

Confirm The Operation

The default password is admin. The password is used to protect the RAID Controller from unauthorized entry. The Controller will check the password only when entering the Main Menu from the initial screen. The RAID Controller will automatically go back to the initial screen when it does not receive any command in ten seconds. To disable the password, leave the fields blank. Once you confirm the modification, the existing password will be cleared. Then, no password checking will occur when entering the main menu.

5.5.7 Update Firmware

GeoVision will periodically release the updated firmware.

To update the firmware, follow these steps:

1. Click **System Controls** and select **Upgrade Firmware**. This page appears.

Upgrade The Raid System Firmware Or Boot Rom

Enter The BootRom Or Firmware File Name

Confirm The Operation

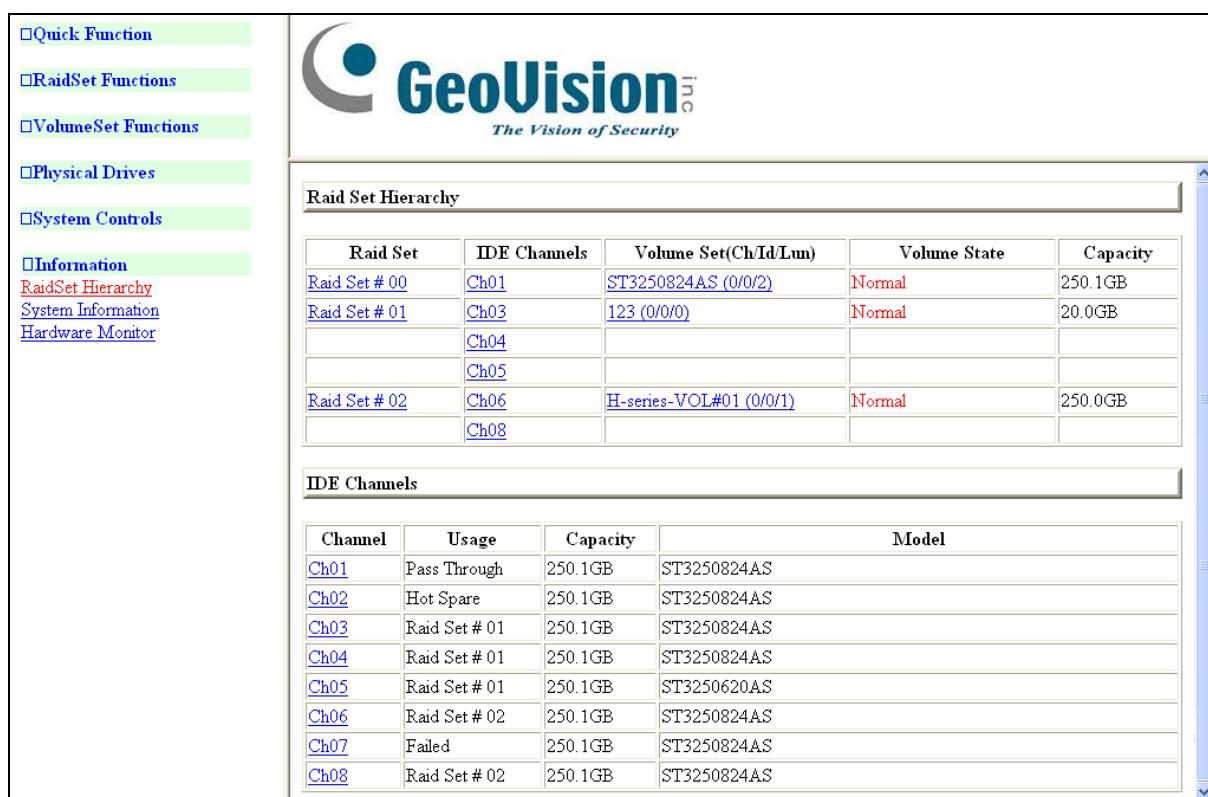

2. Click **Browse...** to locate the firmware file (.bin) saved at your system.
3. Select the **Confirm The Operation** check box and then click **Submit** to start the upgrade.

4. After the firmware upgrade is complete, a bar indicator shows “*Firmware Has Been Updated Successfully.*”
5. Restart the controller or computer for the new firmware to take effect.

5.6 Information

5.6.1 RAID Set Hierarchy

To view the RAID Controller current RAID set, current volume set and physical disk configuration, click **Information** and select **RaidSet Hierarchy**. This page appears.

The screenshot shows the GeoVision RAID Management interface. On the left, a vertical menu bar lists several options: Quick Function, RaidSet Functions, VolumeSet Functions, Physical Drives, System Controls, and Information. Under Information, three sub-options are listed: RaidSet Hierarchy, System Information, and Hardware Monitor. The main content area displays two tables. The top table, titled "Raid Set Hierarchy", shows the following data:

Raid Set	IDE Channels	Volume Set(Ch/Id/Lun)	Volume State	Capacity
Raid Set # 00	Ch01	ST3250824AS (0/0/2)	Normal	250.1GB
Raid Set # 01	Ch03	123 (0/0/0)	Normal	20.0GB
	Ch04			
	Ch05			
Raid Set # 02	Ch06	H-series-VOL#01 (0/0/1)	Normal	250.0GB
	Ch08			

The bottom table, titled "IDE Channels", shows the following data:

Channel	Usage	Capacity	Model
Ch01	Pass Through	250.1GB	ST3250824AS
Ch02	Hot Spare	250.1GB	ST3250824AS
Ch03	Raid Set # 01	250.1GB	ST3250824AS
Ch04	Raid Set # 01	250.1GB	ST3250824AS
Ch05	Raid Set # 01	250.1GB	ST3250620AS
Ch06	Raid Set # 02	250.1GB	ST3250824AS
Ch07	Failed	250.1GB	ST3250824AS
Ch08	Raid Set # 02	250.1GB	ST3250824AS

5.6.2 System Information

To view the SATA RAID controller's information, including name, firmware version, serial number, main processor, CPU data/Instruction cache size and system memory size/ speed, click **Information** and select **System Information**. The “RAID Subsystem Information” page appears.

Raid Subsystem Information

Controller Name	H-series
Firmware Version	V1.39 2006-2-9
BOOT ROM Version	V1.39 2006-1-4
Serial Number	Y614CAABAR200389
Unit Serial #	NVR-000000000001
Main Processor	500MHz IOP331
CPU ICache Size	32KBytes
CPU DCache Size	32KBytes / Write Back
System Memory	128MB / 333MHz

5.6.3 Hardware Monitor

To view the RAID controller's hardware monitor information, click **Information** and select **Hardware Monitor**. The "Hardware Monitor Information" page appears.

Hardware Monitor Information

Fan Speed	2475 RPM
Battery Status	Not Installed
Hdd#1 Temperature	30 °C
Hdd#2 Temperature	29 °C
Hdd#3 Temperature	30 °C
Hdd#4 Temperature	30 °C
Hdd#5 Temperature	48 °C
Hdd#6 Temperature	28 °C
Hdd#7 Temperature	30 °C
Hdd#8 Temperature	29 °C

The Hardware Monitor Information provides the temperature, and fan speed (I/O Processor fan) of the RAID Controller.
